Section I: Executive Summary

Introduction:

The project aims to enhance the John F. Kennedy corridor from Carter Rd to Highway 20 by improving both operational and geometric aspects, with a particular focus on pedestrian safety and non-motorized transportation. Data analysis, including vehicle and pedestrian counts, traffic signal timing plans, and road geometry, will inform comprehensive assessments of current and future conditions. Plans include implementing mixed-use designs to integrate residential and retail areas, creating pedestrian-friendly intersections to facilitate easy access to amenities like retail stores, Hoover Elementary School, and parks, while also ensuring efficient motorized service along the corridor. Overall, the project seeks to balance the needs of pedestrians and motorists while enhancing community connectivity and safety.

Purpose:

This study considers traffic operation and pedestrian accommodations within several intersections of the JFK corridor. The purpose of this report is to evaluate potential benefits and drawbacks associated with each intersection being analyzed to create recommendations as to what best fits each intersection's needs. The focus of the study evaluates the two major intersections, Wacker Dr and John F. Kennedy Rd (JFK), along with Pennsylvania Ave and JFK. Proposed alternative traffic control strategies include changes in traffic signaling and stop sign control on minor street intersections.

Existing Intersections Analysis:

The traffic analysis report provides comprehensive insights into the traffic conditions and intersections along the JFK corridor, focusing on critical intersections, such as Pennsylvania Ave and JFK, Wacker Dr and JFK, as well as minor street intersections. The analysis encompasses various aspects including traffic volumes, level of service (LOS), approach delays, and potential improvements needed for each intersection. The software used to complete this analysis required Highway Capacity Software (HCS) and Synchro, specifically SimTraffic a micro-simulation analysis tool. Along with these analysis tools we used Iowa DOT data from the Iowa Crash Analysis Tool (ICAT) to understand crash data along the corridor and major intersections.

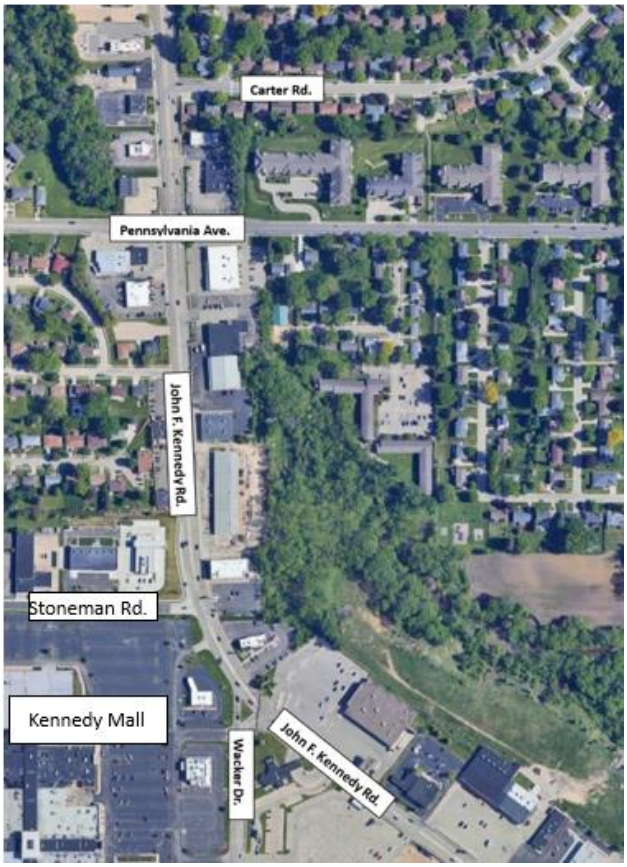

Figure 1. Aerial view displaying the southern portion of the JFK Corridor

At the intersection of Pennsylvania Avenue and JFK, varying levels of service were observed at various times, which include 11am-12pm, 12pm-1pm, 4pm-5pm, 5pm-6pm on Tuesday (February 6th, 2024) and Saturday (February 10th, 2024). Significant differences were noted between the northbound (NB)/southbound (SB) and eastbound (EB)/westbound (WB) directions. Similarly, at the Wacker Dr and JFK intersection, varying LOS and approach delays were observed, particularly for EB/WB traffic. The minor street, Carter Rd. was looked at as a possible area for sidewalk and crosswalk enhancements due to Hoover Elementary School's locatation just Northeast of the Carter Rd and JFK intersection. The LOS of all the intersections mentioned ranged from A to D. The analysis noted potential issues with the software's understanding of intersection geometry, leading to unrealistic delays and LOS ratings. By looking at the analysis, the team was able to determine the critical hour of traffic for each day. The critical hours of traffic found for both Saturday and Tuesday was 12-1 PM.

Additional intersections along the corridor, including Carter Rd, Crestwood Dr, Stoneman Rd, Daykin Ct, and University Ave, were also analyzed. These intersections generally achieved satisfactory LOS ratings of A and B with overall acceptable approach delays, with minimal need for operational or geometric modifications.

Overall, the analysis provides valuable insights into traffic dynamics along the JFK corridor, highlighting areas of congestion and potential improvements needed to optimize traffic

flow and enhance safety. Further studies and assessments are recommended to address specific issues identified, ensuring efficient transportation management and urban planning in the region.

Future Intersections Analysis:

The team conducted a comprehensive analysis of traffic conditions and projections for various intersections, focusing on Pennsylvania Ave and JFK Rd, as well as Wacker Dr and JFK Rd. Utilizing a 1% population growth rate, the group forecasted traffic volumes for 5, 10, and 20 years into the future. At the Pennsylvania Ave and JFK intersection with optimized signaling of the 5-year projection, there are decreases in delays compared to the existing traffic signaling, and the intersection maintains an acceptable level of service (LOS) of C. Optimization strategies effectively minimize overall delay, particularly in the northbound direction. Similar trends are observed in the 10-year projection, with notable improvements in the northbound direction. However, concerns arise in the 20-year projection as certain movements exceed acceptable delay thresholds, when optimizing the 20-year projection it will decrease the delay and allow the intersection to run with a LOS of C which is still acceptable, but this intersection is nearing an unacceptable LOS. This is a sign to look at potential geometric changes in the 20-year window with the delay approaching an unacceptable LOS. Despite improvements in delay, further analysis with sophisticated software is recommended for enhanced projected traffic flow.

Turning to the Wacker Dr and JFK Rd intersection, the 5-year projection demonstrates that existing operational signaling is effective, maintaining an acceptable LOS. Though optimization efforts yield marginal improvements, more sophisticated analysis is required to find significant enhancements. In the 10-year projection, multiple movements experience unacceptable delays, indicating ineffective functionality. Optimization strategies do not substantially improve traffic flow, necessitating further investigation. Similarly, in the 20-year projection, although marginal improvements are observed, several movements still exhibit unacceptable delays. Optimization efforts maintain an overall LOS of C, but more in-depth analysis is required for significant improvements.

Overall, the team's analysis underscores the importance of considering both operational and geometric changes to ensure smooth traffic flow within acceptable parameters as Dubuque's population grows over the next two decades.

Final Design Recommendations:

In the final design recommendations for the JFK Rd corridor, the team proposes a comprehensive set of enhancements to bolster pedestrian safety and optimize traffic flow. To kickstart these improvements, the team suggests utilizing optimization tables provided in the report to update signal timing at the Pennsylvania and JFK intersection. Meanwhile, for the Wacker and JFK intersection; a more sophisticated software system is recommended for further investigation due to minimal improvements observed in most movements.

Addressing pedestrian safety and sidewalk connectivity, the team advocates for the addition of a sidewalk along the west side of JFK from Stoneman Rd to the Wacker Dr and Kennedy Mall intersection. This addition aims to enhance sidewalk connectivity and is

complemented by the reconstruction of sections near the Sunshine Family Restaurant. To facilitate safe pedestrian crossings, the plan involves adding crosswalk markings across the Kennedy Mall entrance and Wacker Dr, along with updating markings across JFK. Additionally, pedestrian pushbuttons are proposed at Wacker Dr and JFK to provide pedestrians with control over signal changes.

To further enhance pedestrian safety, a pedestrian median is advised at the Carter Rd and JFK intersection. This feature will be supplemented by flexible delineators along the sidewalk perimeter, serving to improve safety and discourage cars from encroaching onto pedestrian paths. Moreover, the recommendation includes converting the Carter Rd and Ridge Rd intersection into a 3-way stop, a measure aimed at enhancing safety and traffic management.

In addition to pedestrian-focused enhancements, the proposal also entails adjusted signal timing at major intersections along the corridor's southern portion. These adjustments are intended to reduce overall delay and improve traffic efficiency.

Collectively, these measures represent a comprehensive approach to improving pedestrian infrastructure and traffic flow along the JFK corridor, aligning with the overarching goal of enhancing safety and efficiency for all road users.

Section II: Introduction

This project's objective is to enhance operational and geometric aspects of the John F. Kennedy corridor, particularly focusing on the stretch from Carter Rd to Highway 20. Alongside improvements for motorized vehicles, there's a significant emphasis on enhancing non-motorized transportation, especially pedestrian safety. To assess the corridor comprehensively, data including existing vehicle and pedestrian counts, traffic signal timing plans, and road geometry was utilized. Additionally, the project aimed to evaluate both current and future conditions. Specifically, the city of Dubuque is considering implementing changes aiming for a mixed-use design that integrates residential and retail areas. Given the community layout, it's crucial to create pedestrian-friendly intersections facilitating easy access for residents to nearby amenities such as retail stores, Hoover Elementary School, and parks. Ensuring efficient motorized service along the corridor is also a key consideration alongside pedestrian safety and service levels.

Study Area Description:

Figure 2. Aerial View of Dubuque, IA with JFK Rd highlighted.

Figure 2 (shown above) displays the aerial view of the John F Kennedy Rd. corridor which spans from the NW Arterial to Highway 20. The corridor serves as a key thoroughfare facilitating significant traffic flow.

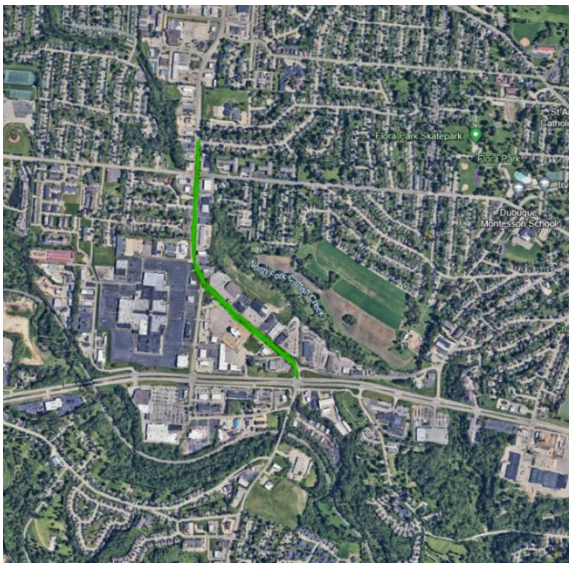

Figure 3. Aerial view of the section of JFK Rd the project is focused on.

The group decided to focus efforts on improving the pedestrian safety and traffic efficiency of the southern section of JFK (spanning from Carter Rd. to University Ave). JFK Rd serves as a major corridor for the city of Dubuque, with the southern section (shown in Figure 2) running adjacent to the Kennedy Mall. The Kennedy Mall is a center for dining and entertainment with approximately 63 businesses in operation. Additionally, JFK Road serves as a vital route for school children attending Hoover and Kennedy Elementary schools. Just south of Asbury Rd lies Dubuque Fire Station #2, overseeing a traffic light directly across the street, despite not marking an intersection. Further down the road, Our Redeemer Lutheran Church is positioned south of the fire station, contributing to the local community fabric.

Section III: Capacity and Level of Service (LOS) Analysis

Manual Vehicle Counts:

The team conducted comprehensive traffic assessments at two critical intersections: John F. Kennedy Road (JFK) and Pennsylvania Ave and Wacker Dr and JFK. Vehicular and pedestrian counts from both Tuesday, February 6th, and Saturday, February 10th, were utilized in the analysis. The video footage was captured during the morning and evening peaks, and the team manually counted the vehicles from 11 AM to 1 PM and from 4 PM to 6 PM, respectively. This comprehensive approach allowed for a thorough examination of traffic and pedestrian flow during peak hours on different days of the week. The limitations of this method of getting traffic counts were found when looking at Wacker and JFK with minimal vision from the footage showing SB left movements, along with no vision of the right turn movements off JFK onto Wacker on the Tuesday video footage.

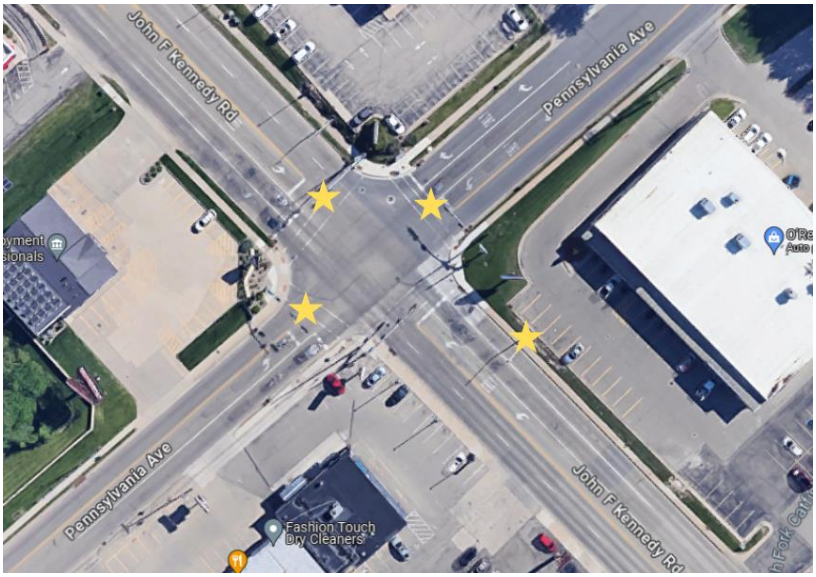

Figure 4. Aerial view displaying the location of cameras used to analyze the JFK Rd. and Pennsylvania Ave. intersection.

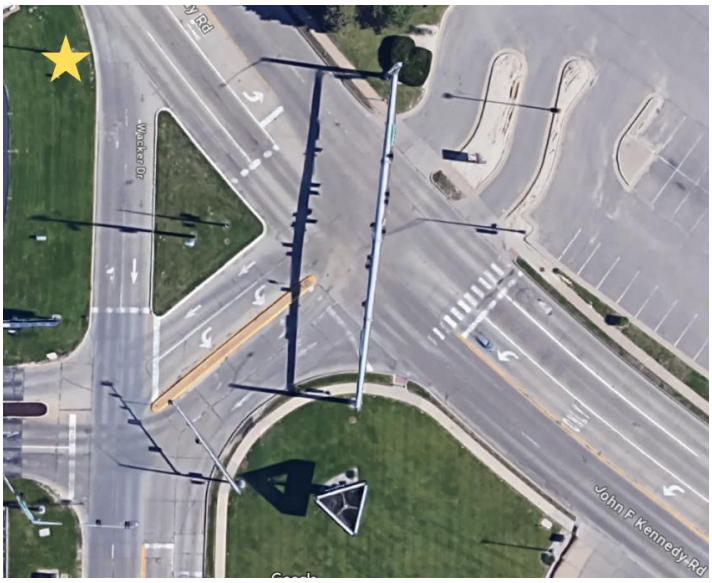

Figure 5. Aerial view displaying the location of cameras used to analyze the JFK Rd. and Wacker Dr. intersection.

The analysis of the Wacker and JFK intersection on Tuesday holds several assumptions. Firstly, due to limitations in the amount of camera angles provided, observations for southbound traffic on JFK turning left into PetSmart parking lot were unavailable during Tuesday's analysis. The team gathered data from Saturday's peak hours (counting 20 and 8 vehicles per hour for the evening peak, with 13 and 13 vehicles per hour for the morning peak) to accurately represent Tuesday's corresponding peak traffic periods. Secondly, right-hand turns from JFK onto Wacker were determined using traffic volume data provided by the Iowa Department of Transportation (DOT). Lastly, there was limited ability for the team to count the vehicles leaving the Kennedy Mall heading eastbound near the intersection of Wacker and JFK. We extrapolated Saturday's peak traffic analysis counts for this movement and included the values in Tuesday's analysis.

For both Tuesday and Saturday's analysis, the team was unable to view the number of vehicles turning right out of the PetSmart parking lot. To address this, the left-hand turn quantity was multiplied by 1.2 to approximate the right-hand turn quantity. This decision was made based on the understanding that northbound traffic on JFK from Wacker Dr typically experiences a 20% higher volume compared to the southbound traffic, indicating that travelers are more likely to go northbound. Under these assumptions, we aimed to ensure an accurate assessment of traffic dynamics at the Wacker and JFK intersection, thereby providing valuable insights for urban planning and transportation management.

Two-Way Stop Control:

The Two-Way Stop Control (TWSC) HCS was used to determine the level of service of minor street intersections (Carter Rd, St Anne Dr, Ridge Rd, Stoneman Rd, Crestwood Dr, University Ave, Daykin Ct) with JFK. The assumptions used for this analysis included using AADT data for volume of vehicles per hour along each intersection. The AADT was used for

these minor intersections as there are no cameras along these spots. Along with an excel sheet using MUTCD turning movement percentiles for arterial and collector roads. As for the pedestrian information in this analysis an assumption was made based on a reference relating to percentage of children who walk to school in the United States. This is from the National Center for Safe Routes to School. The team is using this percentage and multiplying it by the number of children that attend Hoover Elementary School to estimate the number of pedestrians crossing Carter Rd.

Crash Analysis:

In addition to completing manual counts, the team reviewed the Average Annual Daily Traffic (AADT) at all the sections of JFK to observe where heavy traffic was occurring. The team noted which areas of the corridor had the most collisions. Using the Iowa Crash Analysis Tool (ICAT) the intersection of Wacker Dr. and JFK was analyzed. There have been 8 crashes at the intersection since the beginning of 2023, none resulting in serious injury or fatality. The vast majority of incidents were side-swipe style collisions. Two of the 8 incidents involved vehicles running lights. The report also noted that 3 of the remaining 6 crashes were caused by improper or erratic lane change. Unclear lane markings (specifically when taking a right and then immediate left onto JFK) may have contributed to the collisions.

In addition, the intersection at Pennsylvania Ave and JFK was analyzed. Since the beginning of 2023, there have been 35 crashes that have taken place, none of which resulted in a fatality. Over half of the crashes that occurred at the intersection were the result of drivers losing control of their cars and failing to yield the right of way when making a left turn. Additionally, there have been 4 crashes where drivers have failed to yield from traffic making a right turn from the driveway coming out of Domino's heading eastbound onto Pennsylvania Ave. This could be due to the traffic backup that exists at this intersection because the phasing is not optimized at the intersection. The intersection of JFK and Carter Rd was also analyzed. There have been 13 crashes, all minor with no fatalities. Most of the crashes occurred due to either a driver failing to yield or losing control. The majority of crashes that occurred at the three intersections took place between 10 AM and 4 PM.

Synchro:

On Synchro, the team modeled the section of road from HWY 20 to Carter Rd for the existing conditions. The team modeled this section of JFK to mirror real world conditions, namely intersection geometry. All intersections were modeled to have the correct intersection control. At the signalized intersections, signal timing was also modeled correctly. In the model, eight different scenarios were created (corresponding to 8 peak hours) to see the effect traffic had on the corridor. The traffic volumes and turning movements at the various intersections were inputted into model based off the data collected from the traffic videos at the intersections of JFK Rd and Pennsylvania Ave as well as JFK and Wacker Dr. The traffic volumes at the intersections between JFK and some of the minor streets were also added using the calculated values from the excel spreadsheet.

In the Synchro analysis, the team ran 60 different simulation runs for each of the eight scenarios and gathered the data from each of those simulations for the existing conditions and for 5 years from now. Simulation runs were also done for two alternatives to see the impact of what the delay would be if the alternatives were put into place. The data can be seen in the reports for each of the scenarios for the existing conditions and the 5-year projected growth which includes the total amount of delay per vehicle (seconds) denied delay (hours), total delay (hours), stop delay (hours), travel distance (miles), travel time (hours), and density (ft/vehicle) for each of the intersections in the corridor as well as the whole corridor itself.

Highway Capacity Analysis Methods:

The existing conditions at Pennsylvania Ave and JFK Rd. generate acceptable levels of service, which was to be expected considering it is a traditional four-leg intersection. All four of the left turns at the intersection are protected and permitted. It is important to note that vehicles approaching the intersection do so at a significant decline (inherently making braking more difficult).

Analysis of the traffic conditions at the Pennsylvania Ave and JFK intersection on Tuesday from 12PM-1PM are shown above. The existing conditions were optimized to minimize overall delay and successfully did so in the NB/SB directions (with minimal increases in the EB/WB directions). Before and after optimization, the intersection maintained an acceptable level of service, going from an average delay of 21.8 seconds/vehicle to 21.4 seconds/vehicle after optimization (both delays falling into the LOS C range). The intersection experiences a level of service of B for all left turns, and C for all through movements. Pedestrian level of service is not negatively affected by the adjusted signal timing.

The existing conditions at the Wacker Dr and JFK Rd intersection (displayed above in Table 3) show that vehicles experience an intersection delay level of service of B. By and large delay at the intersection is low, except for vehicles going westbound (exiting the PetSmart parking lot). NB/SB traffic experiences an average approach delay of between 14.8 and 16.6 seconds/vehicle while the EB/WB traffic sees approach delays of between 20.9 and 26.3 seconds/vehicle. Considering vehicles exiting the PetSmart parking lot have by far the lowest volume (and there is an alternative parking lot exit south of the intersection) it is expected that this direction would see significantly higher delay than other directions.

Analysis of the optimized traffic conditions at the Wacker Dr and JFK intersection on Tuesday from 12 PM-1PM are shown above. The existing conditions were optimized to minimize overall delay and successfully did so in the NB/SB and WB directions (with a minimal increase of .1 seconds/vehicle in the EB directions). Before and after optimization the intersection maintained an acceptable level of service, going from an average delay of 16.5 seconds/vehicle to 16.4 seconds/vehicle after optimization (both delays falling into the LOS B range). The intersection sees a level of service of B for all left turns apart from the WB direction (which receives a C), and C for all through movements. Pedestrian level of service is not negatively affected by the adjusted signal timing.

 HCS™ Streets Version 2024 Generated: 5/6/2024 9:42:54 AM

The table provides an overview of the existing conditions during Saturday from 12-1 pm, showcasing results across various movement groups. Notably, the absence of data in the EB right movement is explained by the apparent configuration at the top right of the table indicating synchronization between the through movement and the right movement, consolidating data from both sections. Of particular significance for analysis are several key variables: Control Delay, Level of Service (LOS), Approach Delay alongside corresponding LOS, and the overall intersection delay and LOS. Examination of these variables reveals that the Pennsylvania and JFK intersection operates at an average LOS of C, which falls within acceptable parameters. There is no indication of approaching an undesirable LOS of D or exceeding a delay threshold of 35 s/veh. In summary, the existing operational signaling demonstrates effective functionality, ensuring smooth traffic flow within acceptable parameters.

 HCS™ Streets Version 2024 Generated: 5/1/2024 5:41:53 PM

Displayed in the table above are the optimized results for the Pennsylvania and JFK intersection during Saturday from 12-1 pm, building on the previously examined existing conditions. Significantly, improvements are evident, particularly in the total intersection delay, which has decreased by 1.7 s/veh. On closer examination, it becomes apparent that while the control delay and approach delay have increased across certain movements, they have decreased notably from others. Noteworthy is the reduction of 5.2 s/veh in the control delay for SB through movements. This optimization strategy strategically manages delay in each direction, effectively aligning with the traffic volume dynamics of the intersection. In essence, these optimizations contribute to enhancing traffic flow within the intersection, exemplifying a targeted approach to delay management across various movement directions.

The table provides a rundown of the existing conditions during Saturday from 12-1 pm at Wacker and JFK, displaying results across various movement groups. Notably, the absence of data in the EB right and WB through movement is explained by the apparent configuration at the top right of the table indicating synchronization between the through movement and the right movement of the EB direction, as for the WB the configuration combines the through movements with its respective turning lane consolidating data from both sections. Of particular significance for analysis are several key variables: Control Delay, Level of Service (LOS), Approach Delay alongside corresponding LOS, and the overall intersection delay and LOS. Examination of these variables reveals that the Wacker and JFK intersection operates at an average LOS of C, which falls within acceptable parameters. There is no indication of approaching an undesirable LOS of D or exceeding a delay threshold of 35 s/veh. In summary, the existing operational signaling demonstrates effective functionality, ensuring smooth traffic flow within acceptable parameters.

 HCS™ Streets Version 2024 Generated: 5/1/2024 5:41:53 PM

The table above presents the optimized results for the Wacker and JFK intersection during Saturday from 12-1 pm, expanding upon the previously analyzed existing conditions. Although marginal, improvements are observable, particularly in the total intersection delay, which has decreased by a modest 0.1 s/veh. On closer look, it is evident that while the control delay and approach delay have remained relatively stable across most movements, there has been a notable decrease in the EB direction. Particularly noteworthy is the reduction of 0.6 s/veh in the approach delay for all EB movements. This optimization strategy tactically addresses delay in each direction, aligning effectively with the traffic volume dynamics of the intersection. In essence, these optimizations contribute incrementally to enhancing traffic flow within the intersection, showcasing a focused approach to managing delay across diverse movement directions.

Synchro Analysis Methods:

The following Synchro simulation analysis was done using the SimTraffic features. The directions analyzed were found to have the most significant delay per vehicle (seconds) for the two major signalized intersections for the current conditions.

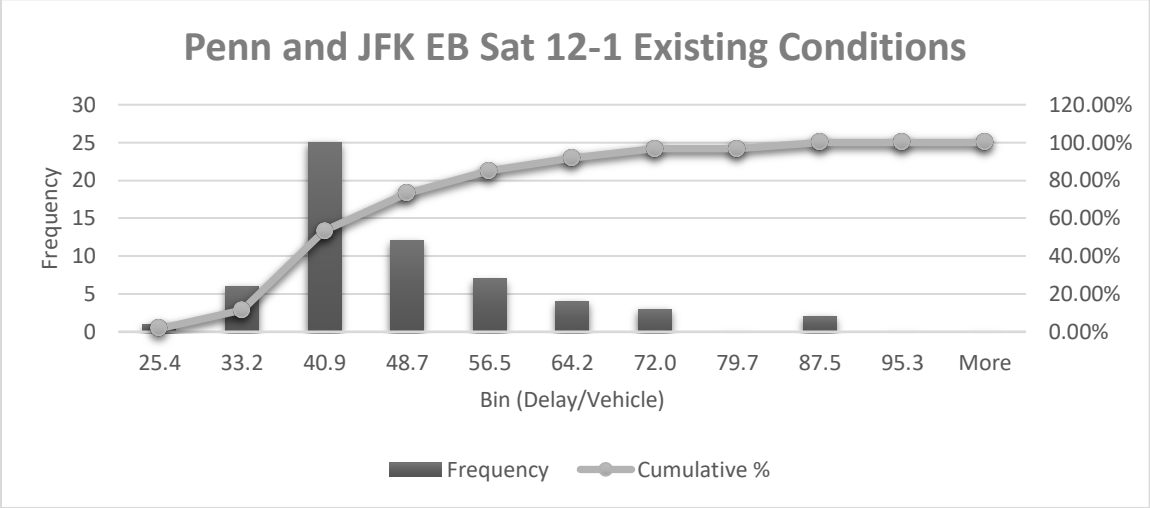

Figure 6. The total delay/vehicle the Penn and JFK intersection going eastbound experienced during the 60 simulation runs from 12-1 on a Saturday.

For each of the 60 simulation runs that were run on SimTraffic, our team obtained a total delay per vehicle. As shown on the graph above, on Saturday (February 10, 2024) at the Pennsylvania Ave and JFK intersection, the traffic going eastbound had approximately 70 percent of the simulation runs have a total delay per vehicle of 48.7 seconds or less. The eastbound direction at this intersection was significant since there were many collisions going out of the driveway about 205 feet from the stop bar of the leg as mentioned earlier. The minimum delay per vehicle for the EB direction was found to be 25.4 seconds while the maximum delay was found to be 87.5 seconds with an average delay of 44.3 seconds. With 95

percent confidence, one could say that the total delay per vehicle would fall between 41 and 47.5 seconds for the eastbound direction of Pennsylvania Ave and JFK.

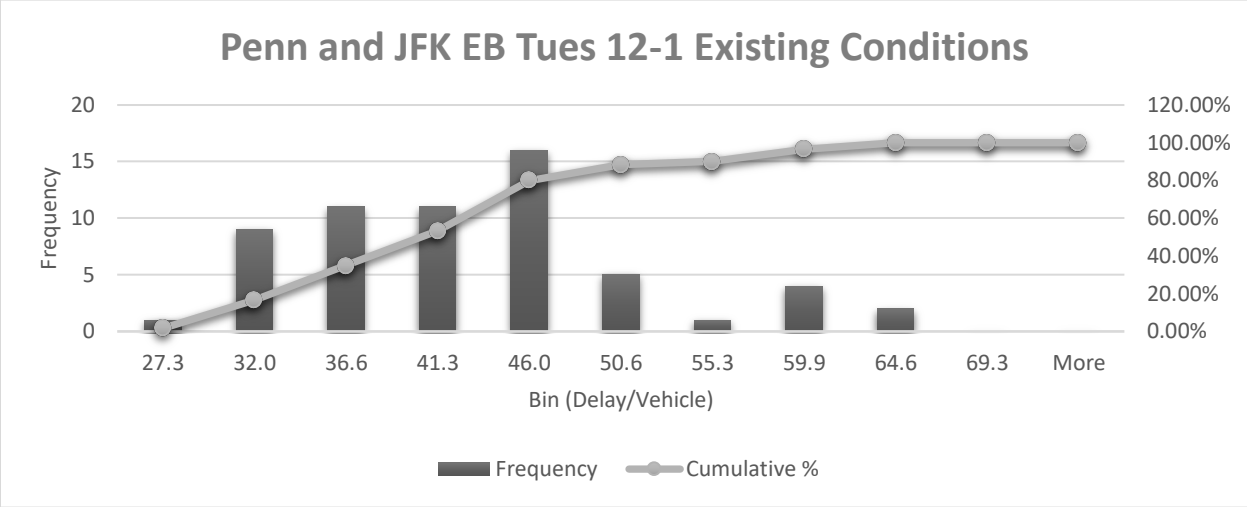

Figure 7. The total delay/vehicle the Penn and JFK intersection going eastbound experienced during the 60 simulation runs from 12-1 on a Tuesday.

For each of the 60 simulation runs off of SimTraffic, our team obtained a total delay per vehicle. As shown on the graph above, on Tuesday (February 6, 2024) at the Pennsylvania Ave and JFK intersection, the traffic going eastbound had approximately 70 percent of the simulation runs have a total delay per vehicle of 46 seconds or less. The minimum delay per vehicle for this direction was found to be 27.3 seconds while the maximum delay was found to be 64.6 seconds with an average delay of 40.6 seconds. With 95 percent confidence, one could say that the total delay per vehicle would fall between 38.3 seconds and 42.8 seconds for the eastbound direction of Pennsylvania Ave and JFK.

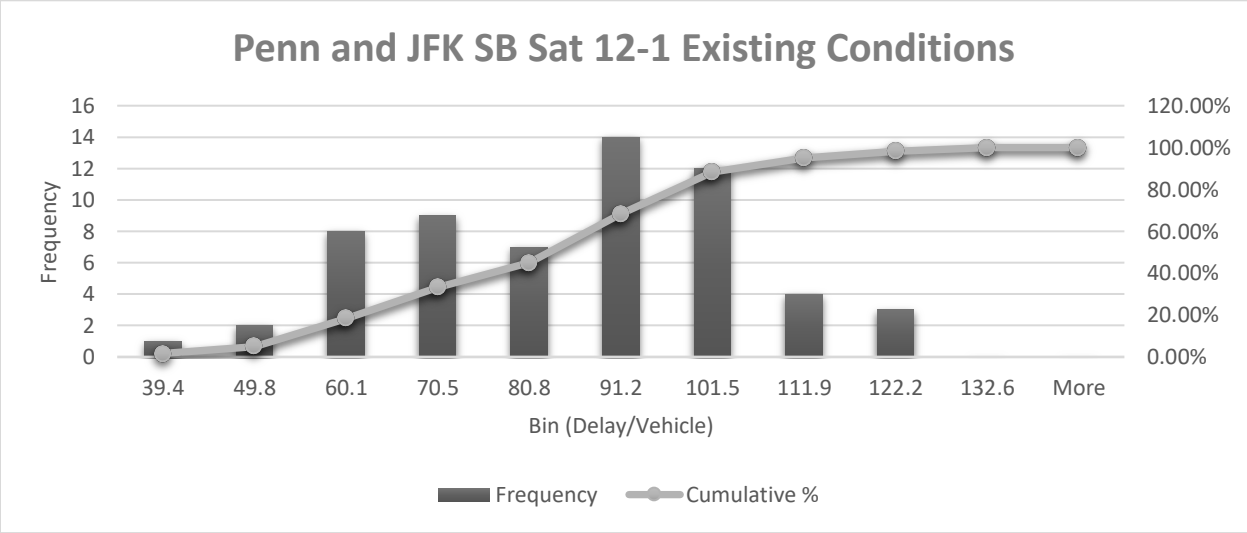

Figure 8. The total delay/vehicle the Penn and JFK intersection going southbound experienced during the 60 simulation runs from 12-1 on a Saturday.

Another direction that was found significant at this intersection was the southbound direction. This leg is significant because it had the largest total delay per vehicle. 60 simulation runs were done on SimTraffic for the southbound direction at Pennsylvania Ave and JFK. The team obtained a total delay per vehicle for each of the simulation runs as shown on the graph above. The Saturday (February 10, 2024) Pennsylvania Ave and JFK intersection results had vehicles going southbound having a delay of 91.2 seconds or less for 70 percent of the simulation runs. The minimum delay per vehicle for the SB direction was found to be 39.4 seconds while the maximum delay was found to be 122.2 seconds (with an average delay of 79.8 seconds). With 95 percent confidence, one could say that the total delay per vehicle would fall between 74.9 seconds and 84.8 seconds for the southbound direction of Pennsylvania Ave and JFK.

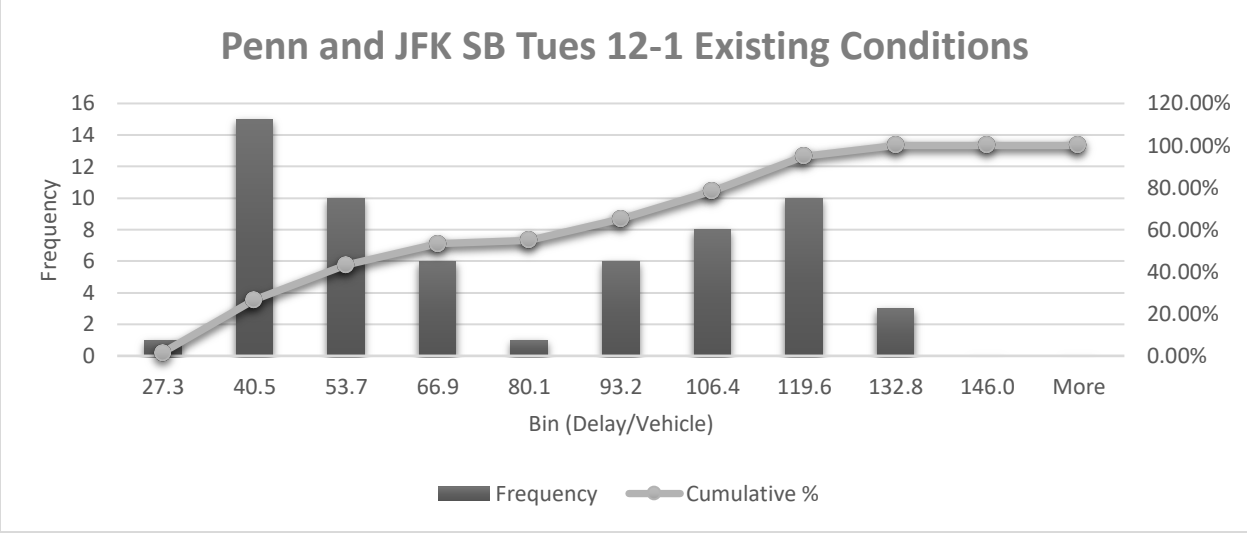

Figure 9. The total delay/vehicle the Penn and JFK intersection going southbound experienced during the 60 simulation runs from 12-1 on a Saturday.

Additionally, 60 simulation runs were done on SimTraffic for the southbound direction at Pennsylvania Ave and JFK for a Tuesday. For 70 percent of the simulation runs done on Tuesday (February 6, 2024) vehicles experienced a total delay of 106.4 seconds or less. The minimum delay per vehicle in the SB direction was found to be 27.3 seconds, while the maximum delay for this direction was 132.8 seconds (with an average delay of 71 seconds). With 95 percent confidence, one could say that the total delay per vehicle would fall between 62.5 seconds and 79.5 seconds for the southbound direction of Pennsylvania Ave and JFK.

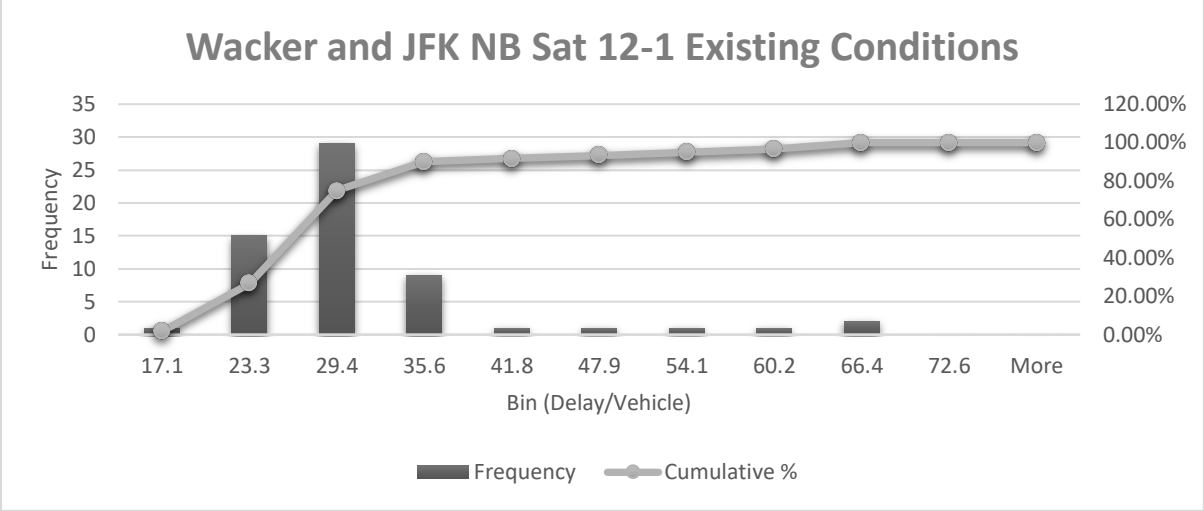

Figure 10. The total delay/vehicle the Wacker and JFK intersection going northbound experienced during the 60 simulation runs from 12-1 on a Saturday.

We also analyzed the total delay per vehicle for the Wacker Dr and JFK intersection. The team felt that the northbound direction was significant in this analysis. We believe this leg of the intersection to be significant because we wanted to analyze the total delay per vehicle at one of the JFK legs and this leg had the highest total delay per vehicle of the two. On Saturday (February 10, 2024) at the Wacker Dr and JFK intersection, northbound vehicles experienced a delay of 29.4 seconds or less for 70 percent of simulation runs. The minimum delay per vehicle for the NB direction was 17.1 seconds, while the maximum delay was 66.4 seconds (with an average delay of 28.4 seconds). With 95 percent confidence, one could say that the total delay per vehicle would fall between 25.9 seconds and 31 seconds for the northbound direction of Wacker Dr and JFK.

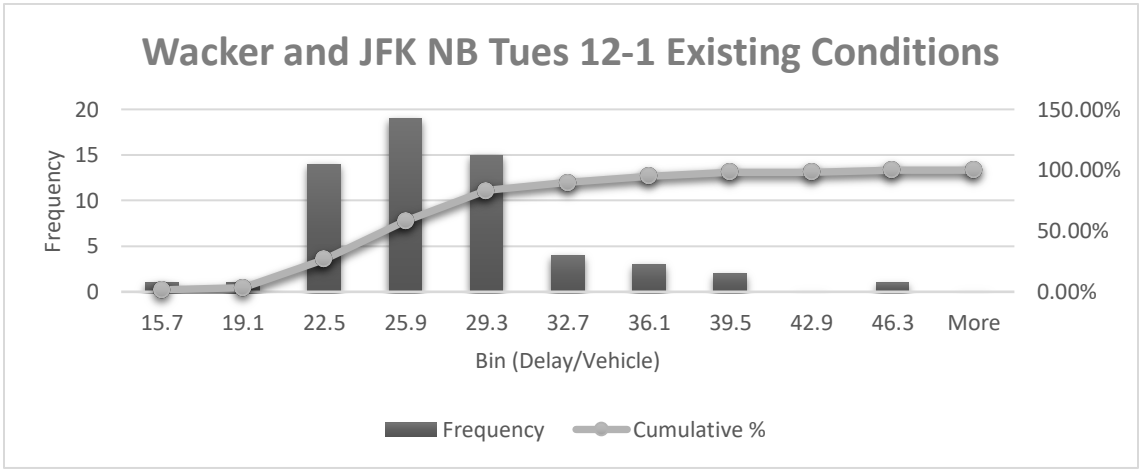

Figure 11. The total delay/vehicle the Wacker and JFK intersection going northbound experienced during the 60 simulation runs from 12-1 on a Tuesday.

The delay per vehicle was also analyzed at the intersection of Wacker Dr and JFK (for vehicles traveling northbound) on Tuesday (February 6, 2024). Vehicles going northbound experienced a delay of 29.3 seconds or less for 70 percent of simulation runs. The minimum delay per vehicle for the NB direction was found to be 15.7 seconds while the maximum delay was 42.9 seconds (with an average delay of 25.7 seconds). With 95 percent confidence, one could say that the total delay per vehicle in the northbound direction at Wacker Dr and JFK would fall between 24.3 seconds and 27 seconds.

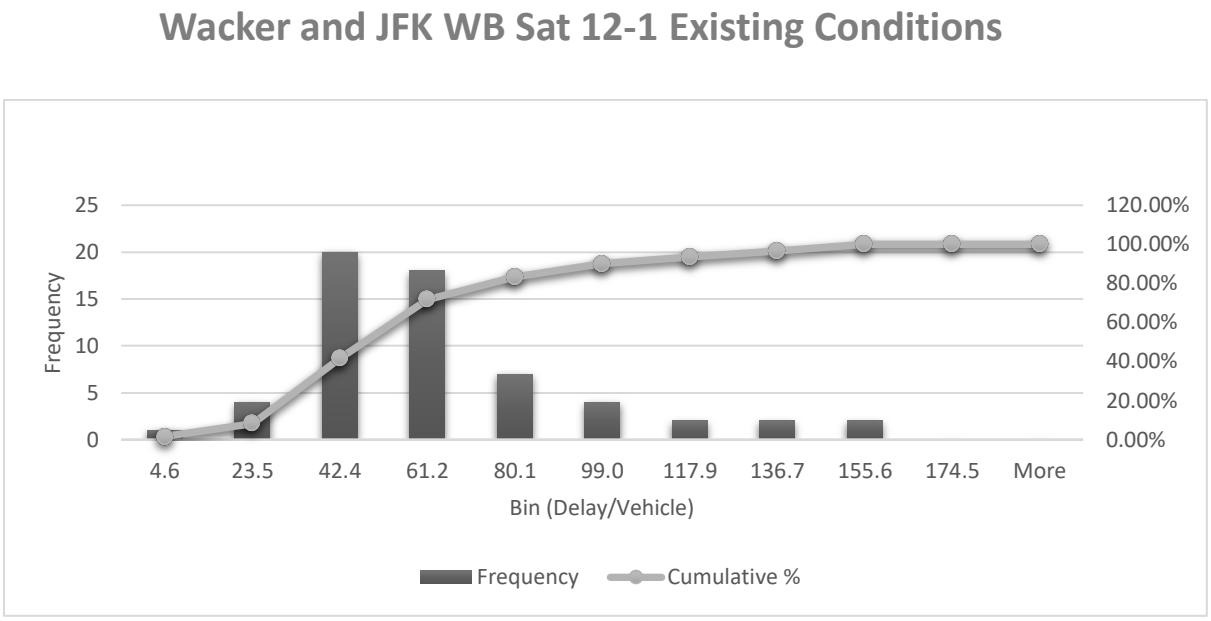

Figure 12. The total delay/vehicle the Wacker and JFK intersection going westbound experienced during the 60 simulation runs from 12-1 on a Saturday.

The delays experienced by a vehicle traveling westbound through Wacker and JFK was analyzed. The east leg of the intersection had the largest total delay per vehicle. On Saturday (February 10, 2024) the Wacker Dr and JFK intersection had westbound vehicles experiencing a delay of 61.2 seconds or less for 70 percent of simulation runs. The minimum delay per vehicle for the WB direction was 4 seconds, while the maximum delay was 155.6 seconds (with an average delay of 53.7 seconds). With 95 percent confidence, one could say that the total delay per vehicle would fall between 45.3 seconds and 62.1 seconds for the westbound direction of Wacker Dr and JFK.

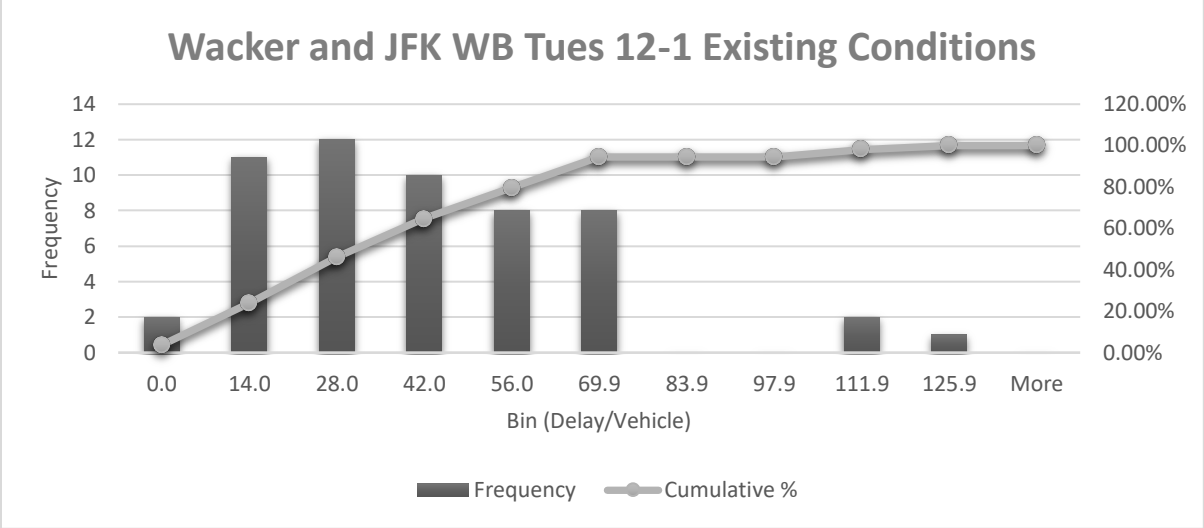

Figure 13. The total delay/vehicle the Wacker and JFK intersection going westbound experienced during the 60 simulation runs from 12-1 on a Tuesday.

Lastly, on Tuesday (February 6, 2024) westbound traffic at the Wacker Dr and JFK intersection, 70 percent of simulation runs resulted in a delay per vehicle of 42 seconds or less. The minimum delay per vehicle for the WB direction was 0 seconds, while the maximum delay was 111.9 seconds (with an average delay of 34.8 seconds). With 95 percent confidence, one could say that the total delay per vehicle would fall between 27.6 seconds and 42 seconds for the westbound direction of Wacker Dr and JFK.

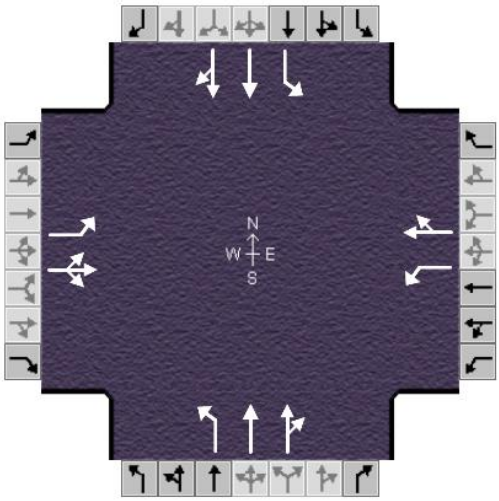

Figure 14. Existing intersection geometry of Wacker Dr and JFK Rd

Above is the existing intersection geometry of Wacker Dr and JFK. It is important to note that WB traffic is exiting a mall, while EB through would be entering the parking lot.

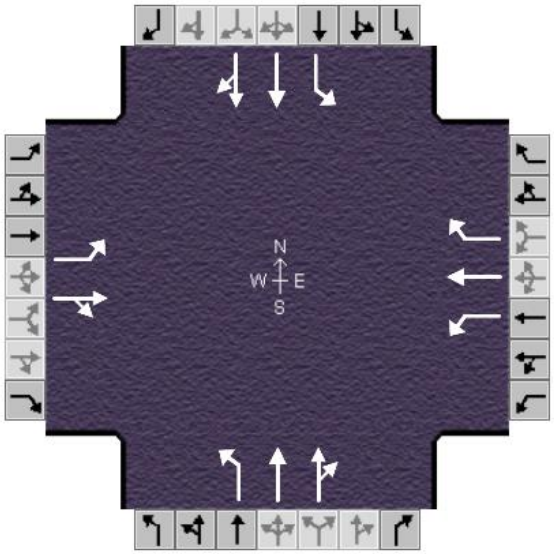

Figure 15. Existing intersection geometry of Pennsylvania Ave and JFK Rd

Shown above is the existing geometric layout of the Pennsylvania Ave and JFK intersection. It is important to note that vehicles driving towards the intersection do so at a significant decline, which contributes to the overall danger of the intersection (by increasing average vehicle speed).

Generated: 4/4/2024 7:11:14 PM

The analysis of the Carter and JFK intersection, as described above, presents the layout of the intersection alongside the vehicle volumes associated with the respective roadways, as determined by the Iowa DOT AADT maps. Additionally, a one-hour sample was conducted for all TWSC reports. The findings indicate a Level of Service (LOS) of A in the northbound and southbound directions, with an approach delay of 1 second per vehicle. However, in the westbound direction, the LOS is C with an approach delay of 16.6 seconds per vehicle. Overall, the intersection is in good standing, with potential opportunities for improvement in the westbound direction.

Crestwood Stop Intersection.xtw

Generated: 4/4/2024 7:11:52 PM

The analysis of the Crestwood and JFK intersection, as detailed above, reveals its layout and the traffic volumes observed on the respective roads, as determined by the Iowa DOT AADT maps. The report indicates that the intersection achieves a Level of Service (LOS) rating of A in the northbound and southbound directions, with an approach delay of 0.1 seconds per vehicle. In the eastbound direction, the intersection has a LOS of B with an approach delay of 12 seconds per vehicle. Based on these findings, it is concluded that the intersection does not require any operational or geometric modifications.

Stoneman Stop Intersection.xtw
Generated: 4/4/2024 7:01:44 PM

The examination of the Stoneman and JFK intersection, as outlined above, showcases its layout and the traffic volumes observed on the respective roads, as determined by the Iowa DOT AADT maps. The analysis reveals a Level of Service (LOS) rating of A in the northbound and southbound directions, with an approach delay of 0.5 seconds per vehicle. In the eastbound direction, the intersection achieves an LOS of A with an approach delay of 10 seconds per vehicle. In summary, it is determined that this intersection does not require any operational or geometric alterations.

The examination of the Daykin and JFK intersection, as detailed above, presents the intersection's layout and the vehicle volumes related to the respective roadways, utilizing data from the Iowa DOT AADT maps. The report indicates a Level of Service (LOS) of A in the northbound and southbound directions, with an approach delay of 2.3 seconds per vehicle in the northbound direction and 0.3 seconds per vehicle in the southbound direction. In the eastbound direction, the intersection achieves a LOS of B with an approach delay of 15 seconds per vehicle. Overall, it is concluded that no operational or geometric changes are necessary for this intersection.

The assessment of the University and JFK intersection provided above outlines the intersection's layout and the traffic volumes associated with the respective roadways, sourced from the Iowa DOT AADT maps. According to the report, the intersection achieves a Level of Service (LOS) rating of A in the northbound and southbound directions, with an approach delay of 0.6 seconds per vehicle. In the eastbound direction, the intersection also attains an LOS of A with an approach delay of 9.7 seconds per vehicle. Overall, it is determined that there is no requirement for operational or geometric changes at this intersection.

Table 14 presents the 5-year projections for the Pennsylvania Ave and JFK Rd intersection. A 1% population growth rate was applied to estimate future traffic volumes. The projected delays are slightly higher than those of the existing conditions. That being said, the intersection still maintains an acceptable level of service in all directions.

Analysis of the projected traffic conditions in 5 years at the Pennsylvania Ave and JFK intersection on Tuesday from Noon-1PM are shown above. The projection conditions were optimized to minimize overall delay and successfully did so in the NB/SB directions (with minimal increases in the EB/WB directions). Before and after optimization the intersection maintained an acceptable level of service, going from an average delay of 22.7 seconds/vehicle to 22.4 seconds/vehicle after optimization (both delays falling into the LOS C range). The intersection sees a level of service of B for all left turns (excluding that of the left-hand turn from Wacker Dr onto JFK which receives a C), and C for all through movements.

Table 16 presents the 10-year projections for the Pennsylvania Ave and JFK Rd intersection. The 1% population growth rate was applied to estimate future traffic volumes. The projected delays continue to increase further into the future the projection goes. Ten years into the future, the intersection still maintains an acceptable level of service in all directions.

Analysis of the projected traffic conditions in 10 years at the Pennsylvania Ave and JFK intersection on Tuesday from Noon-1PM are shown above. Conditions were optimized to minimize overall delay and did so in the NB/SB directions (with minimal increases in the EB/WB directions). The intersection maintained an acceptable level of service, going from an average delay of 24 seconds/vehicle to 23.3 seconds/vehicle after optimization (both delays receiving an acceptable level of service of C). The intersection sees a level of service of B for both the NB and SB left turns, a C for the EB and WB left turns, and C for all through movements.

Analysis of the projected traffic conditions in 20 years at the Pennsylvania Ave and JFK intersection on Tuesday from 12PM-1PM are shown above. Conditions were optimized to minimize overall delay and did so in the NB/SB directions. The NB direction saw a relatively significant drop in delay. The EB/WB directions delays increased (due to the fact that in order to minimize overall delay longer green times were needed for the NB/SB directions). The intersection maintained an acceptable level of service, going from an average delay of 27.3 seconds/vehicle to 25.5 seconds/vehicle after optimization (both delays receiving an acceptable level of service of C). The intersection sees a level of service of B for both the NB and SB left turns, a C for the EB and WB left turns, and C for all through movements.

The 5-year pre-optimization projections at the Wacker Dr and JFK Rd intersection (displayed above in Table 20) show that vehicles experience an intersection delay level of service of B. By and large delay at the intersection is low, except for vehicles going westbound (exiting the PetSmart parking lot). NB/SB traffic experiences an average approach delay of between 15.1 and 17 seconds/vehicle while the EB/WB traffic sees approach delays of between 21.7 and 27.5 seconds/vehicle. Considering vehicles exiting the PetSmart parking lot have by far the lowest volume (and there is an alternative parking lot exit south of the intersection) it is expected that this direction (WB) would see significantly higher delay than other directions.

Bicycle LOS Score / LOS	1.23	A	0.50	A	1.00	A	1.05	A

Intersection signal timing was optimized to minimize overall delay and successfully did so in all directions. Optimization produced slight decreases in delay, but nothing significant enough to improve the (already good) level of service of B. The average intersection delay/vehicle went from 16.9 seconds/vehicle to 16.8 seconds/vehicle.

Bicycle LOS Score / LOS	1.35	A	0.50	A	1.09	A	1.14	A

The 20-year pre-optimization projections at the Wacker Dr and JFK Rd intersection (displayed above in Table 24) show that vehicles experience an intersection delay level of service of B. NB/SB traffic experiences an average approach delay of between 16.7 and 18.8 seconds/vehicle while the EB/WB traffic sees approach delays of between 25 and 32 seconds/vehicle. Vehicles exiting the PetSmart parking lot have by far the lowest volume (and there is an alternative parking lot exit south of the intersection), so it is expected that this direction (WB) would see significantly higher delay than other directions.

Intersection signal timing was optimized to minimize overall delay and successfully did so in the NB/SB directions. EB/WB traffic saw increases in approach delay of .2 seconds/vehicle. The intersection maintained a level of service of B. The average intersection delay/vehicle went from 18.9 seconds/vehicle to 18.6 seconds/vehicle.

 HCS™ Streets Version 2024 Generated: 5/6/2024 9:58:08 AM

The table above is an overview of the projected 5-yr conditions during Saturday from 12PM-1PM, showcasing results across various movement groups. Notably, the absence of data in the EB right movement is explained by the apparent configuration at the top right of the table indicating synchronization between the through movement and the right movement, consolidating data from both sections. Of particular significance for analysis are several key variables: Control Delay, Level of Service (LOS), Approach Delay alongside corresponding LOS, and the overall intersection delay and LOS. Examination of these variables reveals that the Pennsylvania and JFK intersection operates at an average LOS of C, which falls within acceptable parameters. There is no indication of approaching an undesirable LOS of D or exceeding a delay threshold of 35 s/veh. In summary, the existing operational signaling demonstrates effective functionality for the 5-yr projection, ensuring smooth traffic flow within acceptable parameters.

 HCS™ Streets Version 2024 Generated: 5/1/2024 5:54:27 PM

Displayed in the table above are the optimized results for the 5-yr projected conditions at Pennsylvania and JFK intersection during Saturday from 12PM -1PM, building upon the

previously examined 5-yr conditions. Significantly, improvements are evident, particularly in the overall intersection delay, which has decreased by 1.9 s/veh. Upon closer examination, it becomes clear that while the control delay and approach delay remain mostly constant across certain movements, they have notably decreased in the NB direction as the approach delay decreases by 5.6 s/veh. This is ultimately the control delay and approach delay in the NB direction have the contributing factors in the optimization to bring the overall intersection delay down. This optimization strategy strategically manages delay in each direction, effectively aligning with the traffic volume dynamics of the intersection. In essence, these optimizations were able to minimize overall intersection delay to maintain an acceptable LOS.

 HCS™ Streets Version 2024 Generated: 5/1/2024 6:07:30 PM

Displayed in the table above are the optimized results for the 10-yr projected conditions at Pennsylvania and JFK intersection during Saturday from 12PM-1PM, building upon the previously examined 10-yr conditions. Significantly, improvements are evident, particularly in the overall intersection delay, which has decreased by 2.6 s/veh. Upon closer examination, it becomes clear that while the control delay and approach delay remain mostly constant across certain movements, they have notably decreased in the NB direction as the approach delay decreases by 8.5 s/veh. This ultimately indicates the control delay and approach delay in the NB direction have the main contributing factors in the optimization to bring the overall intersection delay down. This optimization strategy manages delay in each direction, effectively aligning with the traffic volume dynamics of the intersection. In essence, these optimizations were able to minimize overall intersection delay to maintain an acceptable LOS.

 HCS™ Streets Version 2024 Generated: 5/6/2024 10:04:35 AM

The table provided above is an overview of the projected 20-yr conditions during Saturday from 12PM - 1 PM, showcasing results across various movement groups. There is a concern for the 20-yr projections as based on the 1% growth rate provided to use for volume projections. As the SB through and right movements exceed the acceptable threshold by 15-20 s/veh. Also the EB through movement hits the unacceptable LOS mark by 0.6 s/veh. In summary, the existing operational signaling indicates that geometric changes will need to be examined at this intersection within the 20-yr window of this corridor to ensure smooth traffic flow within acceptable parameters.

The table above provides a rundown of the 5-yr projected conditions during Saturday from 12PM-1PM at Wacker and JFK, displaying results across various movement groups. Notably, the absence of data in the EB right and WB through movement is explained by the apparent configuration at the top right of the table indicating synchronization between the through movement and the right movement of the EB direction, as for the WB the configuration combines the through movements with its respective turning lane consolidating data from both sections. Of particular significance for analysis are several key variables: Control Delay, Level of Service (LOS), Approach Delay alongside corresponding LOS, and the overall intersection delay and LOS. Examination of these variables reveals that the Wacker and JFK intersection operates at an average LOS of C, which falls within acceptable parameters. There is one indication of approaching an undesirable LOS of D or exceeding a delay threshold of 35 s/veh at the SB left movement. In summary, the overall existing operational signaling demonstrates effective functionality, ensuring smooth traffic flow within acceptable parameters.

The table above presents the optimized results for the Wacker and JFK intersection during Saturday from 12PM-1PM, expanding upon the previously analyzed 5-yr projected conditions. Although marginal, improvements are observable, particularly in the total intersection delay,

which has decreased by a modest 0.1 s/veh. Upon closer look, it is evident that while the control delay and approach delay have remained relatively stable across most movements, there has not been much improvement to delay at this intersection. This optimization strategy does not improve traffic delay through this software by a marginal amount therefore it will need to be investigated with a more sophisticated software to allow the exact configuration of the Wacker and JFK intersection. In essence, these optimizations from HCS are unable to enhance traffic flow within the intersection needing a more in-depth analysis tool to dissect this intersection.

 HCS™ Streets Version 2024 Generated: 5/6/2024 10:03:19 AM

The table above provides a rundown of the 10-yr projected conditions during Saturday from 12PM-1PM at Wacker and JFK, displaying results across various movement groups. There are multiple unacceptable movements as shown in the table above. This shows undesirable LOS of D or exceeding a delay threshold of 35 s/veh at all movements in certain directions. In summary, the overall existing operational signaling demonstrates ineffective functionality, causing large delays and unacceptable traffic flow through the corridor.

 HCS™ Streets Version 2024 Generated: 5/1/2024 6:13:34 PM

The table above presents the optimized results for the Wacker and JFK intersection during Saturday from 12PM-1PM, expanding upon the previously analyzed 20-yr projected conditions. Although marginal, improvements are observable, particularly in the total intersection delay, which has decreased by 3.8 s/veh. Upon closer look, it is evident that while the control delay and approach delay have changed drastically across most movements with a decrease of nearly 10 s/veh for the approach delays and 15 s/veh for the EB through and NB left turn, there has been much improvement to delay at this intersection. This optimization strategy does improve traffic delay through this software therefore it will provide Wacker and JFK intersection to efficiently run with a LOS C. As seen the highlighted portions in red are indicating high areas of concern and will need to be considered when looking to decide between geometric and operational changes to these intersections. In essence, these optimizations from HCS did maintain an overall LOS of C.

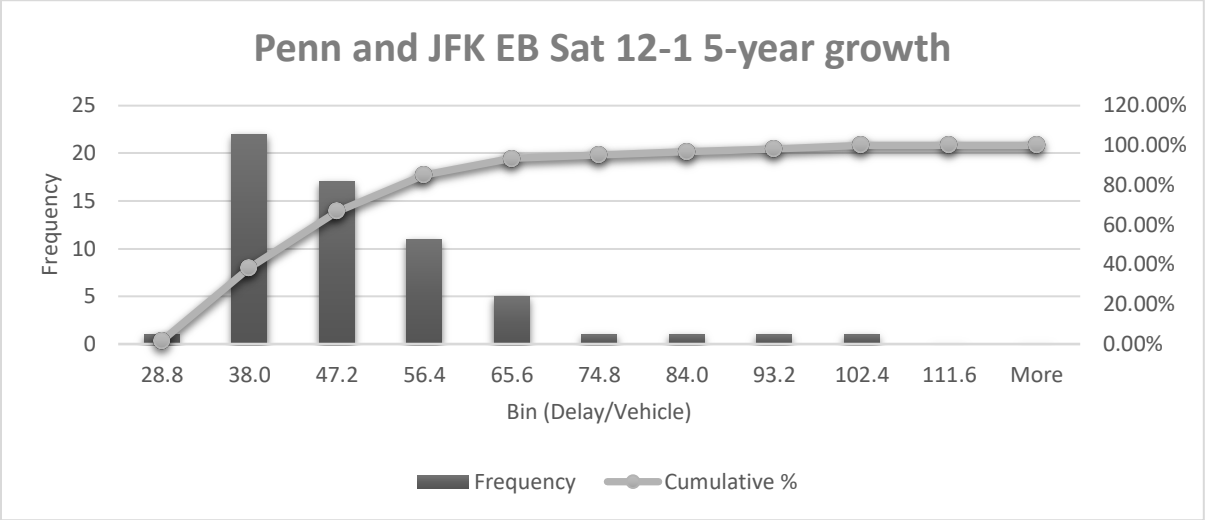

Figure 16. The total delay/vehicle the Penn and JFK intersection going eastbound experienced during the 60 simulation runs from 12-1 on a Saturday with a 5-year population growth.

Using a 1% population growth rate to project traffic volumes 5 years into the future, the team found that at the Pennsylvania and JFK intersection, eastbound traffic experienced a total delay per vehicle of 47.2 seconds or less for 70 percent of simulation runs using extrapolated traffic volumes from Saturday, (February 10th, 2024). The minimum delay per vehicle for the EB direction was found to be 28.8 seconds, while the maximum delay was 102.4 seconds (with an average delay of 45.7 seconds). With 95 percent confidence, one could say that the total delay per vehicle would fall between 42 and 49.3 seconds for the eastbound traffic at Pennsylvania Ave and JFK. Compared to existing conditions where the total delay per vehicle would be between 41 and 47.5 seconds with 95 percent confidence. Since there is some overlap between the two intervals, the change in the total delay per vehicle 5 years from now would not be significant.

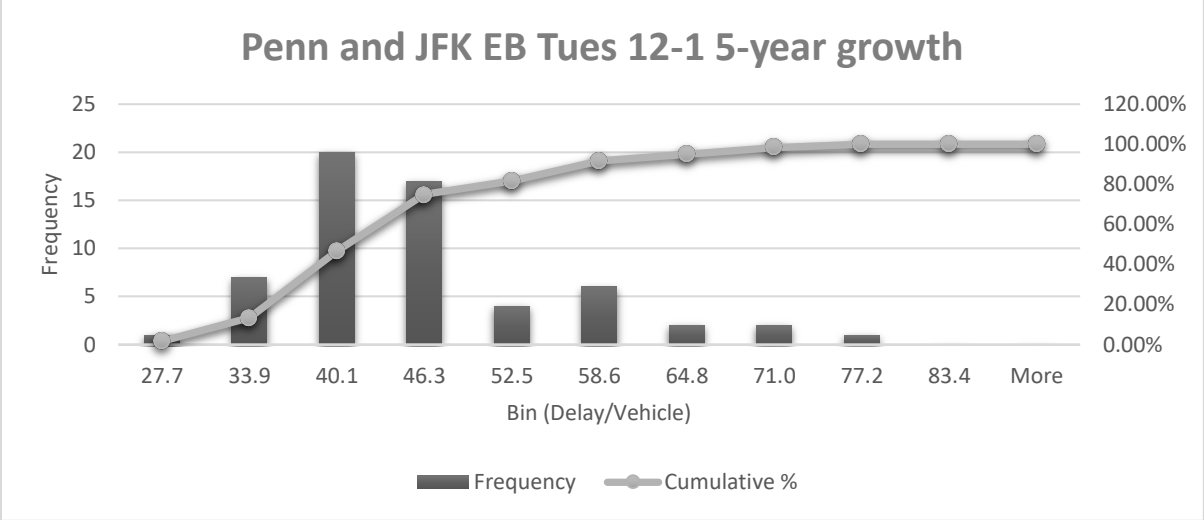

Figure 17. The total delay/vehicle the Penn and JFK intersection going eastbound experienced during the 60 simulation runs from 12PM-1PM on a Tuesday with a 5-year population growth.

Using projected traffic volumes from the Tuesday (February 6th, 2024) the total delay per vehicle 5 years from now was found to be 46.3 seconds or less for 70 percent of simulation runs. The minimum delay per vehicle for the EB direction was found to be 27.7 seconds, while the maximum delay was 77.2 seconds, with an average delay of 43.7 seconds. With 95 percent confidence, one could say that the total delay per vehicle of eastbound traffic would fall between 41 and 46.2 seconds. Comparing that to the existing, the total delay per vehicle would be between 38.3 and 42.8 seconds with 95 percent confidence. Since there is some overlap between the two intervals, the change in the total delay per vehicle 5 years from now would not be significant.

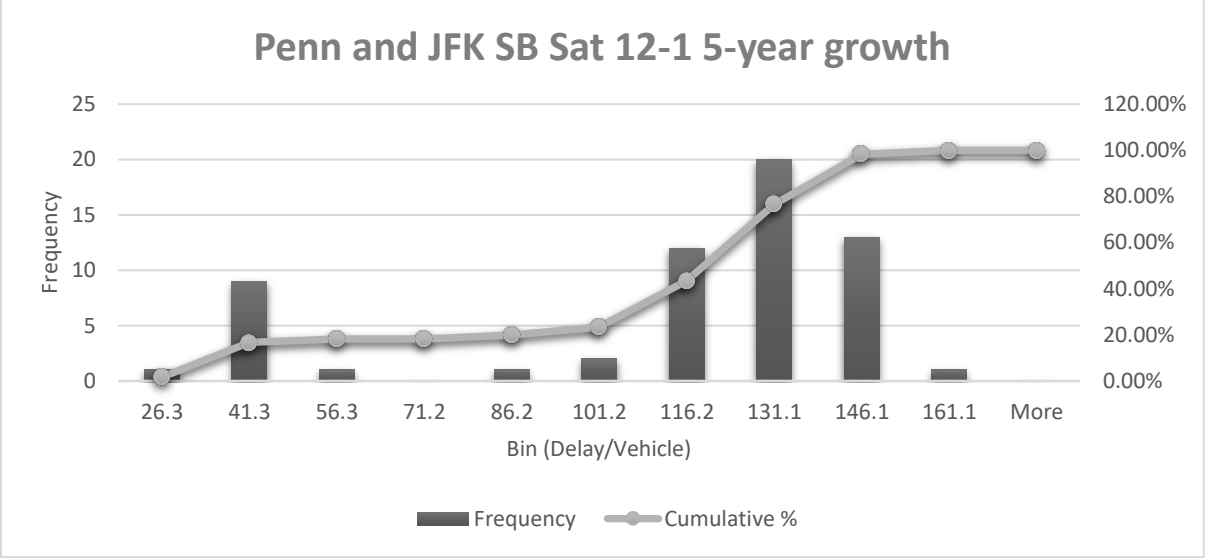

Figure 18. The total delay/vehicle the Penn and JFK intersection going southbound experienced during the 60 simulation runs from 12PM-1PM on a Saturday with a 5-year population growth.

For Southbound traffic at Pennsylvania Ave and JFK (in 5 years), 70 percent of simulations totaled a delay per vehicle of 131.1 seconds or less. The minimum delay per vehicle for the SB direction was 26.3 seconds, while the maximum delay was 146.1 seconds (with an average delay of 105.6 seconds). With 95 percent confidence, one could say that the total delay per vehicle would fall between 96.3 and 114.9 seconds for the southbound direction of Pennsylvania Ave and JFK. Compared to the existing, the total delay per vehicle would be between 74.9 and 84.8 seconds with 95 percent confidence. Since there is no overlap between the two intervals, the change in the total delay per vehicle 5 years from now would be significant.

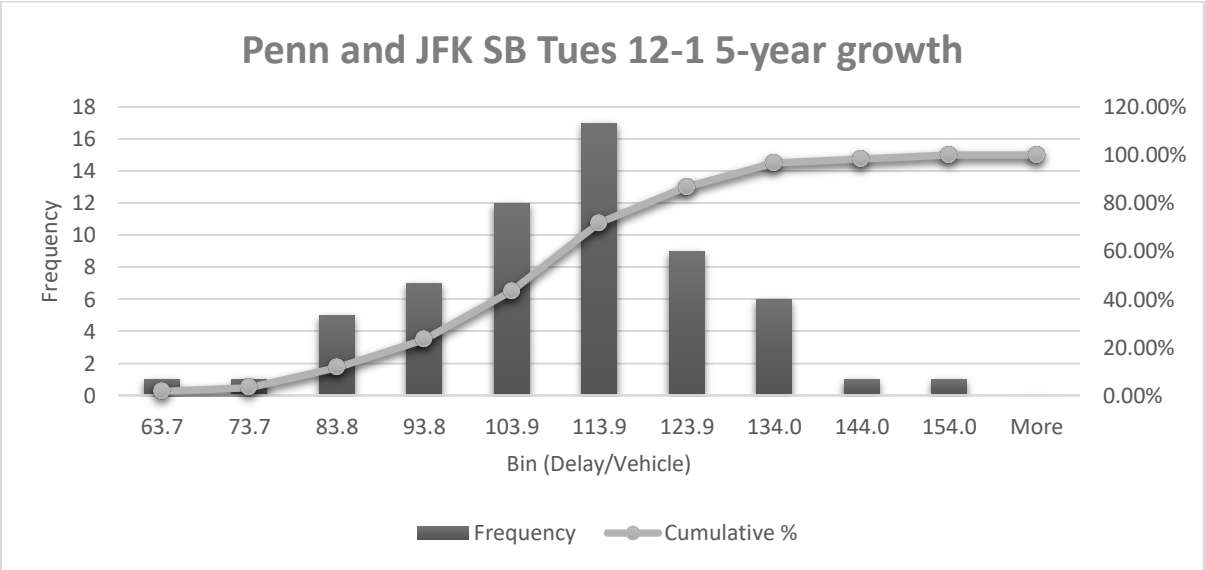

Figure 19. The total delay/vehicle the Penn and JFK intersection going southbound experienced during the 60 simulation runs from 12PM-1PM on a Tuesday with a 5-year population growth.

Using volumes from Tuesday, the team found that 70 percent of the 60 simulation runs resulted in a total delay per vehicle (southbound traffic) of 113.9 seconds or less. The minimum delay per vehicle for the SB direction was found to be 63.7 seconds, while the maximum delay was 144 seconds (with an average delay of 105.3 seconds). With 95 percent confidence, one could say that the total delay per vehicle, in the southbound direction, would fall between 101 and 109.6 seconds. Comparing that to the existing, the total delay per vehicle would be between 62.5 and 79.5 seconds with 95 percent confidence. Since there is no overlap between the two intervals, the change in the total delay per vehicle 5 years from now would be significant.

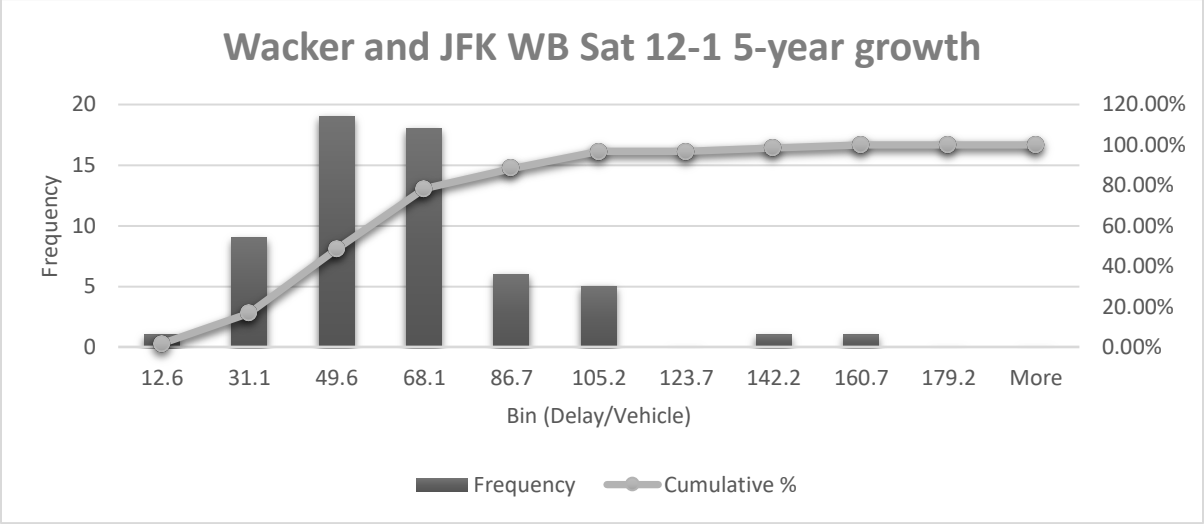

Figure 20. The total delay/vehicle the Wacker and JFK intersection going westbound experienced during the 60 simulation runs from 12PM-1PM on a Saturday with a 5-year population growth.

Traffic forecasting was also done for westbound traffic at the Wacker Dr and JFK intersection, with a 1% population growth rate to simulate conditions 5 years from now. Using the extrapolated volumes from Saturday (February 10th, 2024) the team found that 70 percent of simulation runs resulted in a total delay per vehicle of 68.1 seconds or less, for westbound traffic. The minimum delay per vehicle for the WB direction was 12.6 seconds, while the maximum delay was 160.7 seconds (with an average delay of 53.9 seconds). With 95 percent confidence, one could say that the total delay per vehicle (experienced by westbound traffic) would fall between 47 and 60.9 seconds. Compared to the existing, the total delay per vehicle was found to be in between 45.3 and 62 seconds with 95 percent confidence. Since there is an overlap between the two intervals, the change in the total delay per vehicle 5 years from now would not be significant.

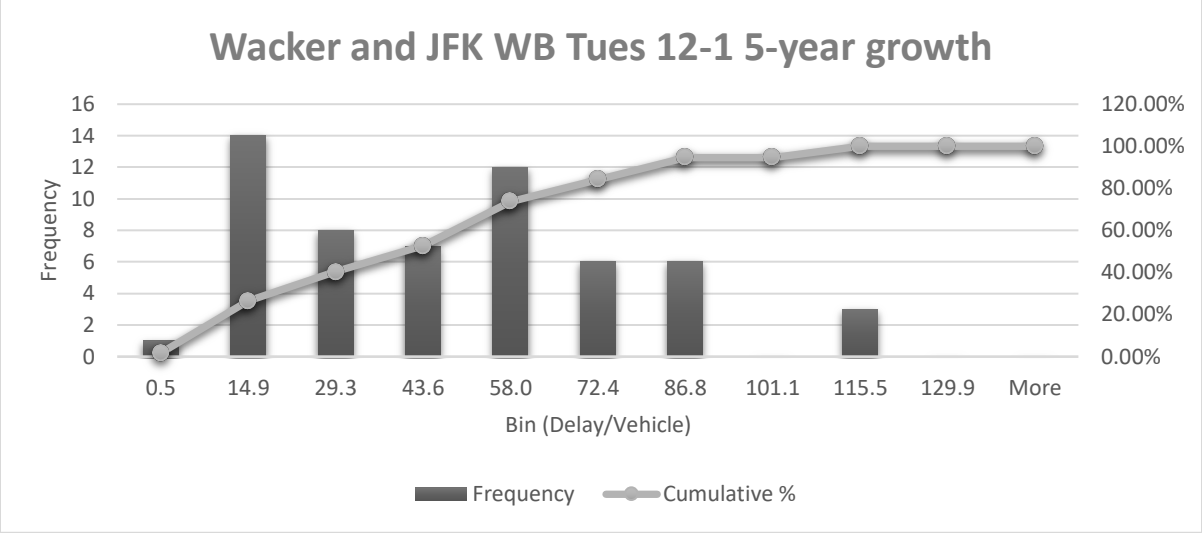

Figure 21. The total delay/vehicle the Wacker and JFK intersection going westbound experienced during the 60 simulation runs from 12PM-1PM on a Tuesday with a 5-year population growth.

Using extrapolated volumes from Tuesday (February 6th, 2024) the team found that 70 percent of simulation runs (of westbound traffic at Wacker Dr and JFK) resulted in a total delay per vehicle of 58 seconds or less. The minimum delay per vehicle for the WB direction was 0.5 seconds, while the max delay was 115.5 seconds (with an average delay of 41.1 seconds). With 95 percent confidence, one could say that the total delay per westbound vehicle would fall between 33.4 and 48.7 seconds. Comparing that to the existing, the total delay per vehicle was found to be in between 27.6 and 42 seconds with 95 percent confidence. Since there is an overlap between the two intervals, the change in the total delay per vehicle 5 years from now would not be significant.

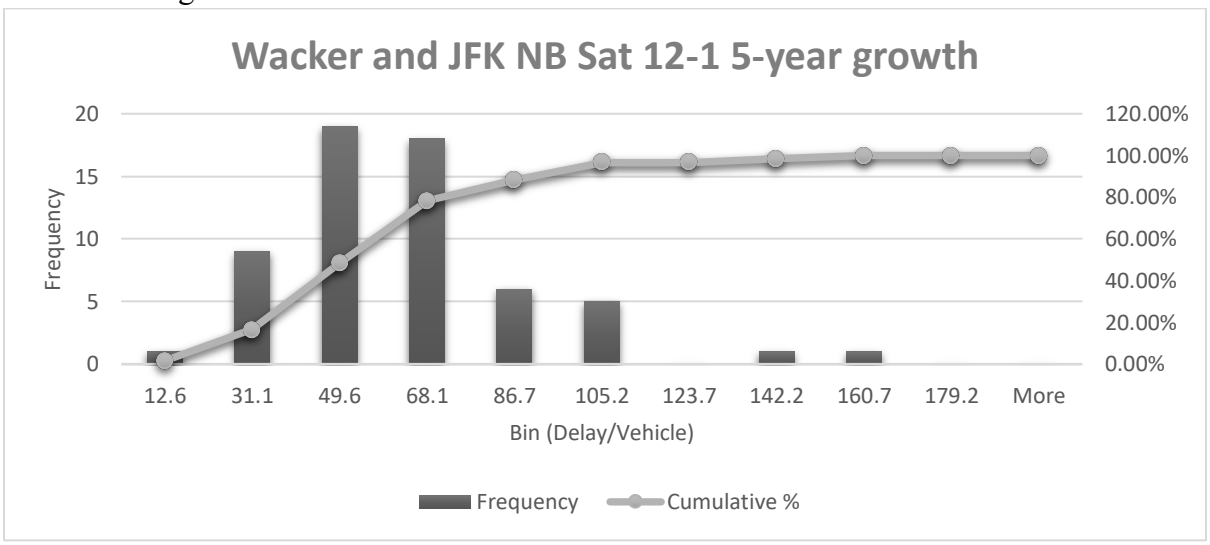

Figure 22. The total delay/vehicle the Wacker and JFK intersection going northbound experienced during the 60 simulation runs from 12-1 on a Saturday with a 5-year population growth.

The last direction analyzed by the team at Wacker Dr and JFK for a 5-year traffic forecast was the northbound direction. Using extrapolated volumes from Saturday (February 10th, 2024) the team found that 70 percent of the 60 simulation runs resulted in a total delay per northbound vehicle of 68.1 seconds or less. The minimum delay per vehicle for the NB direction was 12.6 seconds, while the maximum delay was 160.7 seconds, with an average delay of 53.9 seconds. With 95 percent confidence, one could say that the total delay per northbound vehicle (at Wacker Dr and JFK) would fall between 47 and 60.9 seconds. Comparing that to the existing, the total delay per vehicle was found to be in between 25.9 and 31 seconds with 95 percent confidence. Since there is no overlap between the two intervals, the change in the total delay per vehicle 5 years from now would be significant.

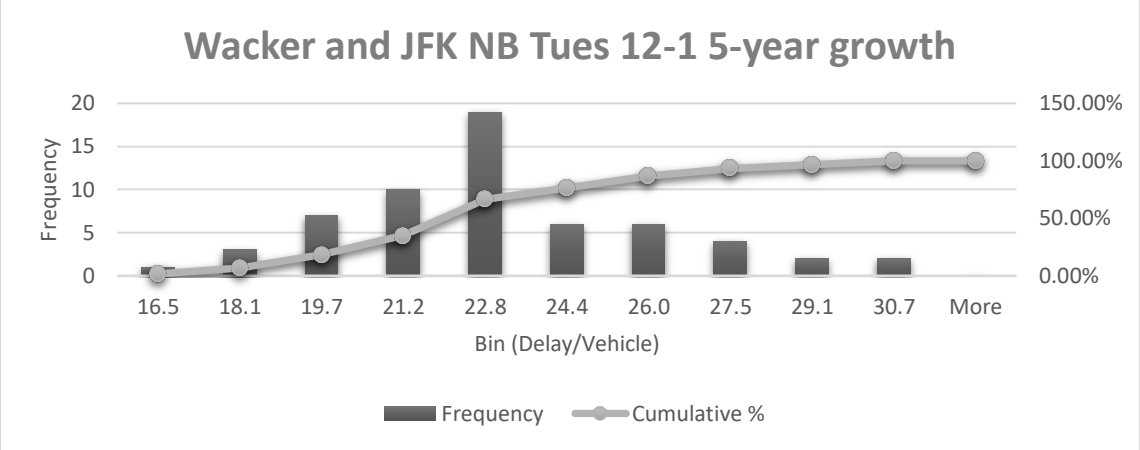

Figure 23. The total delay/vehicle the Wacker and JFK intersection going northbound experienced during the 60 simulation runs from 12PM-1PM on a Tuesday with a 5-year population growth.

Using extrapolated volumes from Tuesday, February 6th, 2024, 70 percent of simulation runs resulted in a total delay per northbound vehicle of 22.8 seconds or less. The minimum delay per vehicle for the NB direction was 16.5 seconds, while the maximum delay was 29.1 seconds (with an average delay of 22.2 seconds). With 95 percent confidence, one could say that the total delay per vehicle would fall between 21.5 and 23 seconds for the northbound direction of Wacker Dr and JFK. Comparing that to the existing, the total delay per vehicle was found to be in between 24.3 and 27 seconds with 95 percent confidence. Since there is overlap between the two intervals, the change in the total delay per vehicle 5 years from now would not be significant.

The team is using a 1% population growth rate for the city of Dubuque to forecast the future traffic volumes that would occur at each intersection from University Ave and JFK to Carter Rd and JFK. The impact of traffic is being analyzed for 5, 10, and 20 years from now. At the Pennsylvania Ave and JFK intersection.

Impact Assessment

The most common cause of crashes at the intersection of Wacker Dr and JFK Rd was improper or erratic lane changing. To improve clarity for drivers, the team recommends repainting all intersection markings, especially that of the left-hand turn from Wacker Dr onto

JFK (going NB). When the team visited the intersection the left-hand turn striping had been completely worn off, essentially leaving the width of the turn up to driver's discretion. Since snow plowing and the application of sand/salt wears the markings down quickly, the team recommends the city consider including reflective turn striping on the turn (possibly installed in divets).

Comparing the results of the two alternatives (the three-way stop with and without the pedestrian median), there was a significant drop in delays on Carter (because people going westbound on Carter instead of waiting for the left will be taking the right. That said, installing the pedestrian median does lead to a slight increase in delay at the Pennsylvania Ave and JFK intersection due to the fact that vehicles traveling southbound on JFK will not be able to take a left onto Carter. Shown in red is the route likely to be used by vehicles coming from the north (as you can see there will be an increase in volume of vehicles traveling on Hillcrest Rd). Shown in green and yellow are the routes most likely to be used by vehicles from the south dropping kids off at school (with the yellow area representing the area most kids will be dropped off at). As you can see there will be an increase in traffic on residential streets especially Churchill Dr.

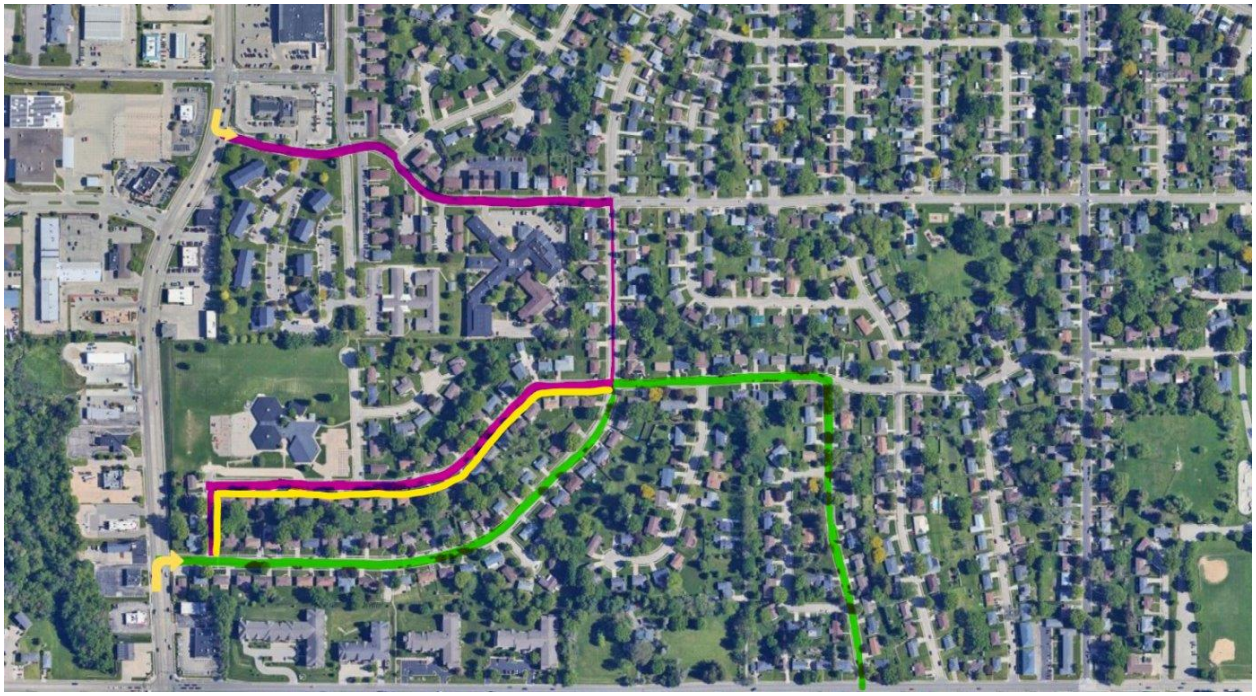

Figure 24. Aerial view of the routes likely to be taken by parents dropping children off at school if the pedestrian median at Carter Rd. and JFK Rd is constructed.

Mitigation Measures:

As a result of the increased volume of traffic on the residential roads, further analysis will need to be done to identify if the roads can handle the increased volume. A trial run of the pedestrian median using flexible delineators or barriers can be used to test the effectiveness of the design as well as the driver's response to the changes.

Section V: Alternative Solutions to be Considered

One of the main alternatives our team is proposing is adding a 3-way stop at Carter Rd and Ridge Rd. Additionally, another alternative our team is proposing is adding a pedestrian median on Carter Rd and JFK while also incorporating a 3-way stop on Carter Rd and Ridge Rd. While adding the three-way stop at Carter Rd and Ridge Rd may be the cheaper option, our team recommends constructing a pedestrian median at the Carter Rd and JFK intersection, while also incorporating the 3-way stop at Carter Rd and Ridge Rd. The affect this option would have at the intersection is that it would cause there to be a right-in and right-out only into and out of Carter Rd from JFK. This option is also more expensive and will be more impactful on the flow of traffic, however it addresses the issue of pedestrians trying to cross JFK.

The table above depicts the introduction of an all-way stop at the Carter and Ridge Intersection, positioned east of the Carter and JFK intersection. It's clear that even with this proposed alteration, the intersection maintains its efficiency, mirroring its current functionality with only the stop sign at Ridge. Our main aim was to gauge whether the eastbound direction would encounter significant delays due to vehicles entering Carter from JFK. However, the data indicates that this addition does not hinder the intersection's performance. This trend persists across all projected conditions spanning 5 years, 10 years, and 20 years. There's minimal variance in control and approach delays among all conditions, while the Level of Service (LOS) remains consistently rated as A. As shown in the tables below.

3-WAY STOP GRAPHS:

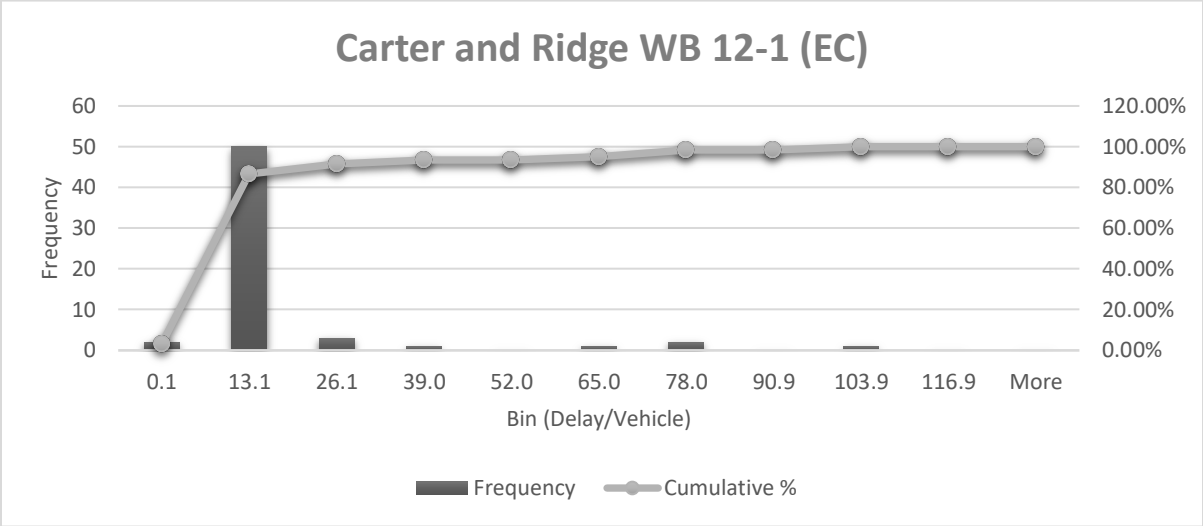

Figure 17. The total delay/vehicle the Carter and Ridge intersection going westbound experienced during the 60 simulation runs from 12PM-1PM on a Saturday.

Out of the 60 simulations ran simulating the existing conditions at Carter and Ridge Rd (on Saturday from 12-1), 90 percent resulted in a total delay per westbound vehicle of approximately 13.1 seconds or less.

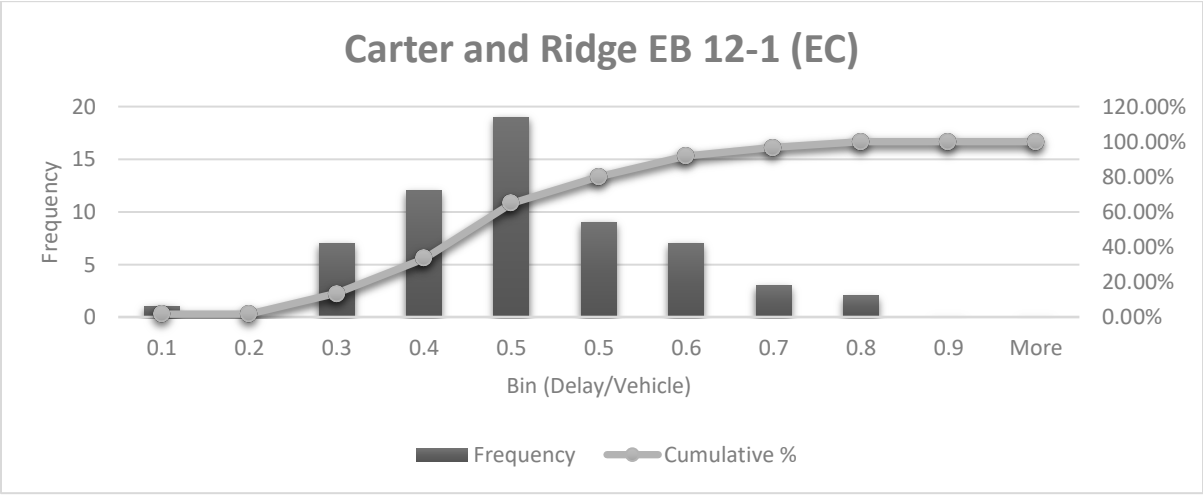

Figure 18. The total delay/vehicle the Carter and Ridge intersection going eastbound experienced during the 60 simulation runs from 12PM-1PM on a Saturday.

Out of the 60 simulations ran simulating the existing conditions at Carter and Ridge Rd (on Saturday from 12-1), 90 percent resulted in a total delay per eastbound vehicle of approximately .6 seconds or less.

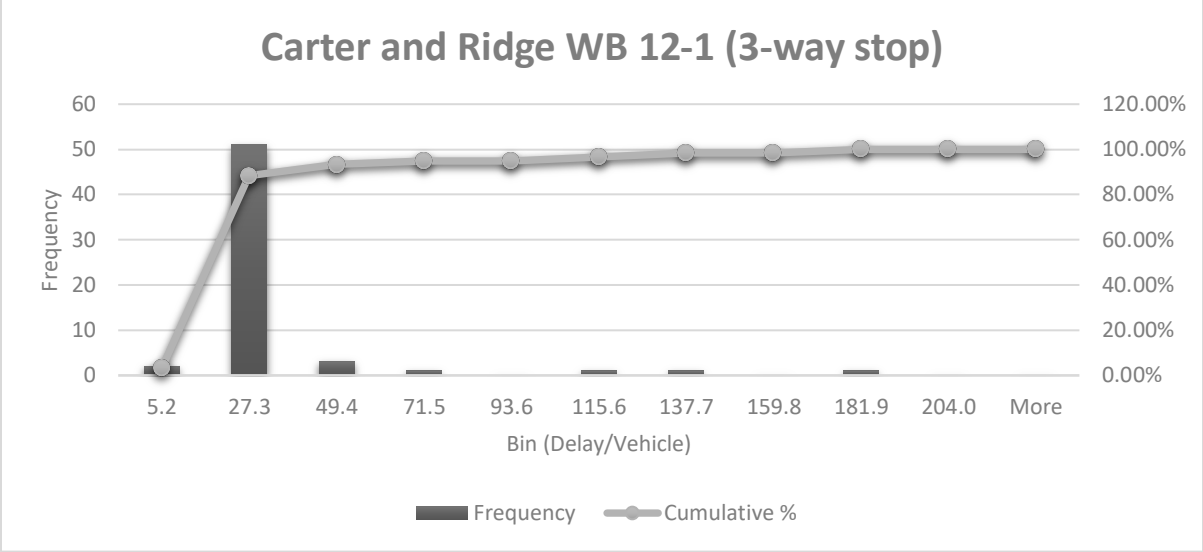

Figure 19. The total delay/vehicle the Carter and Ridge intersection with a 3-way stop going westbound experienced during the 60 simulation runs from 12pm-1 pm on a Saturday.

Out of the 60 simulations ran, simulating the conditions at Carter and Ridge Rd (if a 3-way stop was implemented) 90 percent resulted in a total delay per westbound vehicle of approximately 27.3 seconds or less.

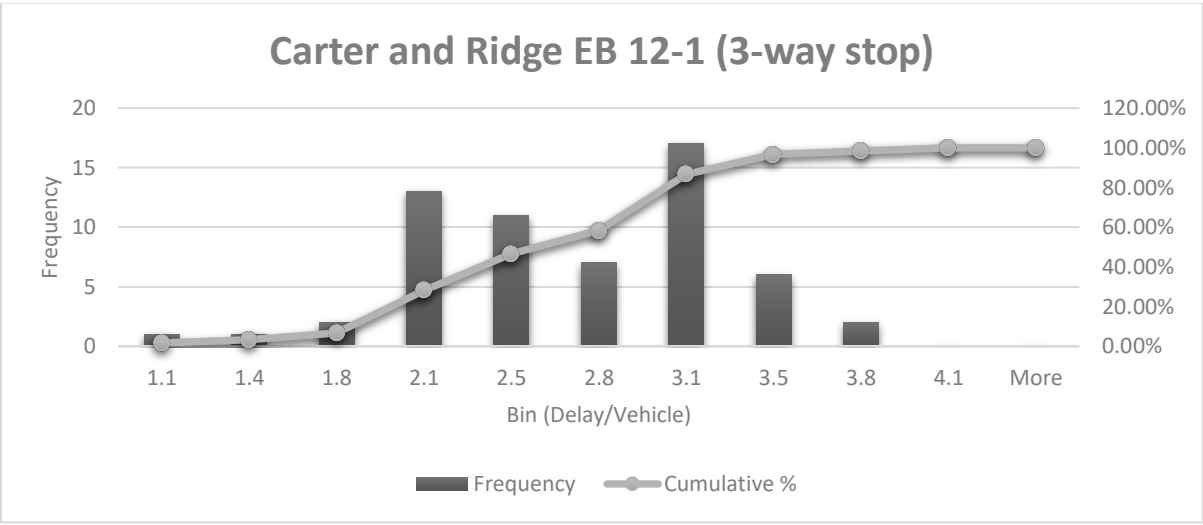

Figure 20. The total delay/vehicle the Carter and Ridge intersection with a 3-way stop going eastbound experienced during the 60 simulation runs from 12PM-1PM on a Saturday.

Out of the 60 simulations ran, simulating the conditions at Carter and Ridge Rd (if a 3-way stop was implemented) 90 percent resulted in a total delay per eastbound vehicle of approximately 3.1 seconds or less.

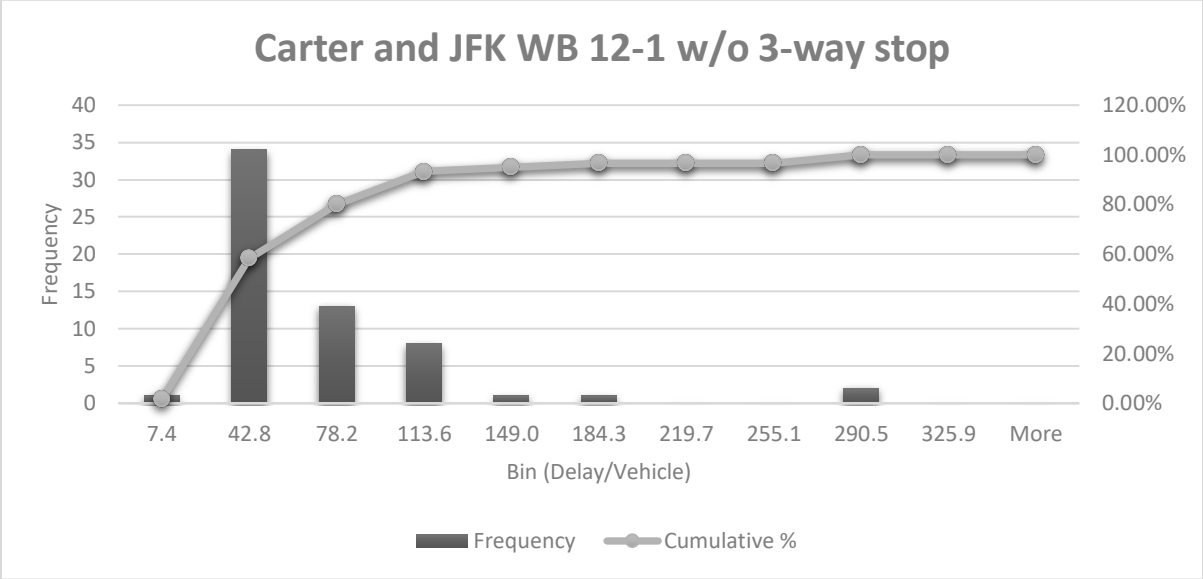

Figure 21. The total delay/vehicle the Carter and JFK intersection without a 3-way stop going westbound experienced during the 60 simulation runs from 12PM-1PM on a Saturday.

Of the 60 simulations ran at Carter Rd and JFK without a 3-way stop, around 80 percent resulted in a total delay per vehicle of 78.2 seconds or less going westbound. The minimum delay per vehicle for the westbound direction was 7.4 seconds, while the maximum delay was 290.5 seconds (with an average delay of 53.9 seconds). With 95 percent confidence, one could say that the total delay per vehicle would fall between 40.2 and 67.5 seconds for the westbound direction of Carter Rd and JFK.

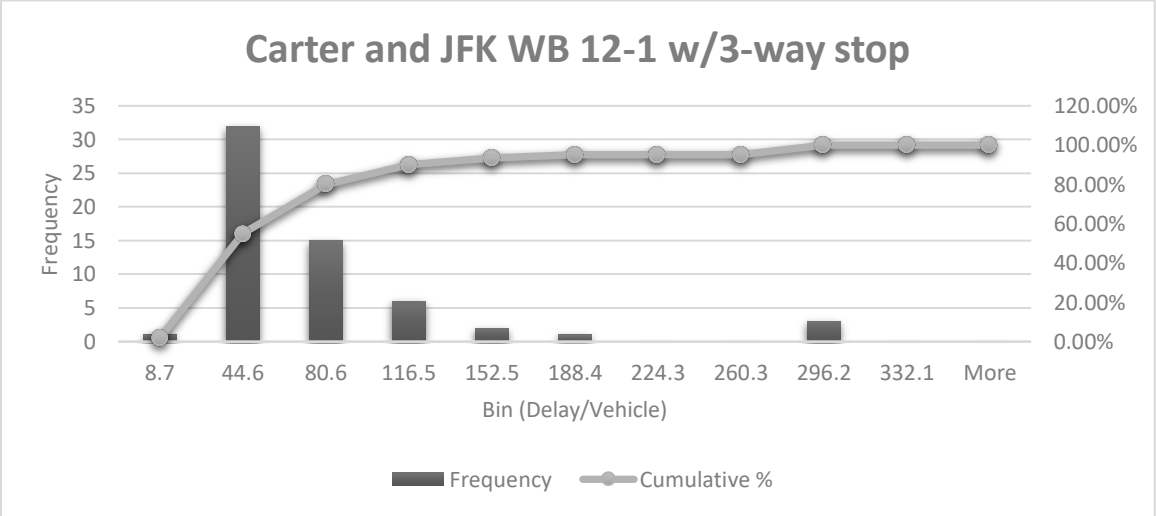

Figure 22. The total delay/vehicle the Carter and JFK intersection with a 3-way stop going westbound experienced during the 60 simulation runs from 12PM-1PM on a Saturday.

Of the 60 simulations ran at Carter Rd and JFK with a 3-way stop, around 80 percent resulted in a total delay per vehicle of 116.5 seconds or less going westbound. The minimum delay per vehicle for the westbound direction was 8.7 seconds, while the maximum delay was 296.2 seconds (with an average delay of 61.4 seconds). With 95 percent confidence, one could say that the total delay per vehicle would fall between 45.5 and 77.3 seconds for the westbound direction of Carter Rd and JFK.

Pedestrian-Median GRAPHS:

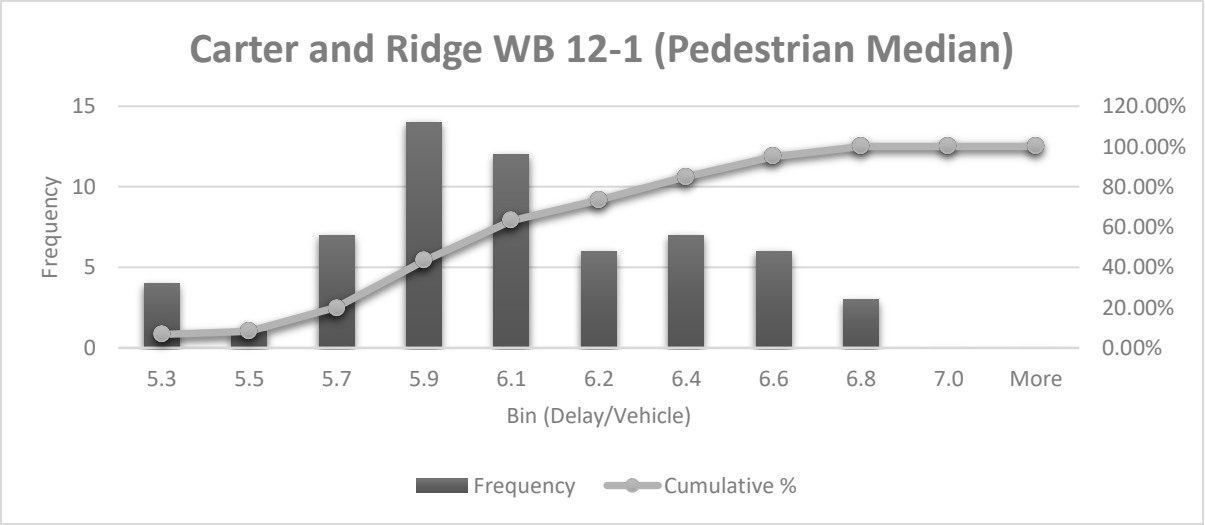

Figure 23. The total delay/vehicle the Carter and Ridge intersection with a pedestrian median going westbound experienced during the 60 simulation runs from 12-1PM on a Saturday.

Of the 60 simulations ran at Carter Rd and Ridge Rd with a pedestrian median, around 80 percent resulted in a total delay per vehicle of 6.4 seconds or less going westbound. The minimum delay per vehicle for the westbound direction was 5.3 seconds, while the maximum delay was 6.8 seconds (with an average delay of 6 seconds). With 95 percent confidence, one could say that the total delay per vehicle would fall between 5.9 and 6.1 seconds for the westbound direction of Carter Rd and JFK with a pedestrian median.

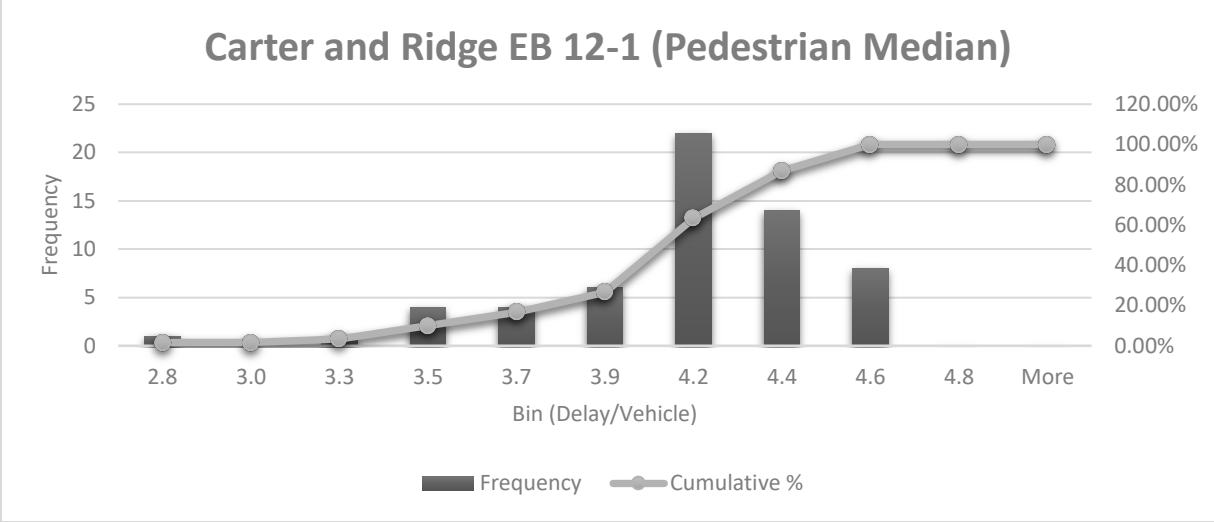

Figure 24. The total delay/vehicle the Carter and Ridge intersection with a pedestrian median going eastbound experienced during the 60 simulation runs from 12-1 PM on a Saturday.

Of the 60 simulations ran at Carter Rd and Ridge Rd with a pedestrian median, around 80 percent resulted in a total delay per vehicle of 4.4 seconds or less going eastbound. The minimum delay per vehicle for the eastbound direction was 2.8 seconds, while the maximum delay was 4.6 seconds (with an average delay of 4 seconds). With 95 percent confidence, one could say that the total delay per vehicle would fall between 3.9 and 4.1 seconds for the eastbound direction of Carter Rd and Ridge Rd with a pedestrian median.

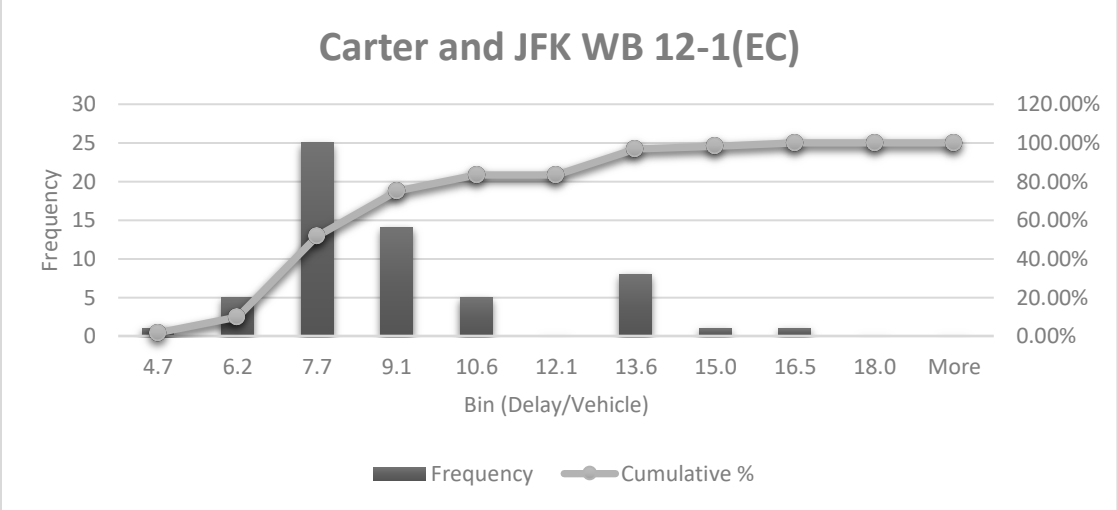

Figure 25. The total delay/vehicle the Carter and JFK intersection with a pedestrian median going westbound experienced during the 60 simulation runs from 12-1PM on a Saturday.

Of the 60 simulations ran at Carter Rd and JFK with a pedestrian median, around 80 percent resulted in a total delay per vehicle of 12.1 seconds or less going westbound. The minimum delay per vehicle for the westbound direction was 4.7 seconds, while the maximum

delay was 16.5 seconds (with an average delay of 8.4 seconds). With 95 percent confidence, one could say that the total delay per vehicle would fall between 7.7 and 9 seconds for the westbound direction of Carter Rd and JFK with a pedestrian median.

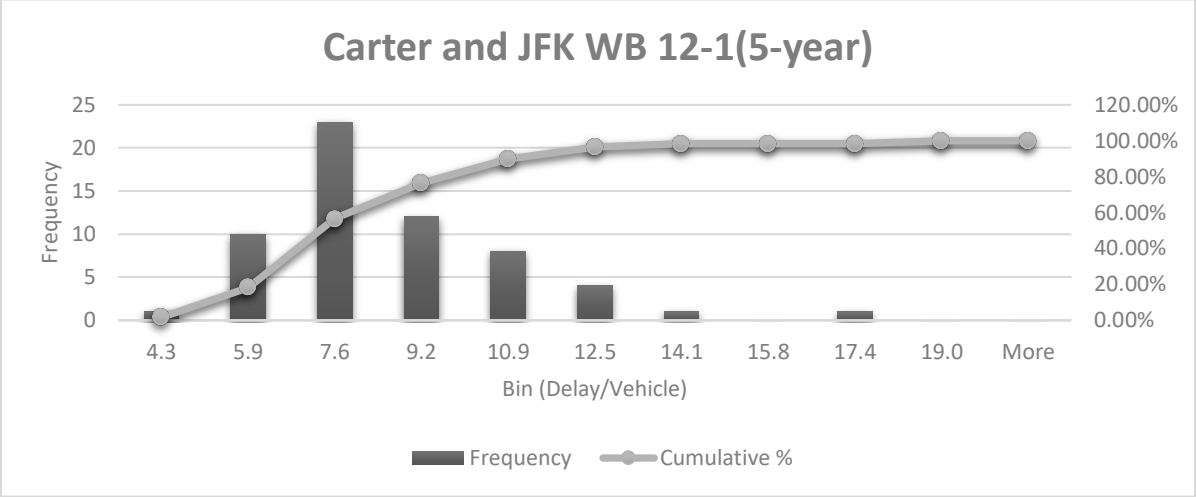

Figure 26. The total delay/vehicle the Carter and JFK intersection with a pedestrian median going westbound experiences 5 years from now during the 60 simulation runs from 12-1PM on a Saturday.

Of the 60 simulations ran at Carter Rd and JFK with a pedestrian median for a 5-year projected traffic forecast, around 80 percent resulted in a total delay per vehicle of 9.2 seconds or less going westbound. The minimum delay per vehicle for the westbound direction was 4.3 seconds, while the maximum delay was 17.4 seconds (with an average delay of 7.9 seconds). With 95 percent confidence, one could say that the total delay per vehicle would fall between 7.2 and 8.5 seconds for the westbound direction of Carter Rd and JFK with a pedestrian median.

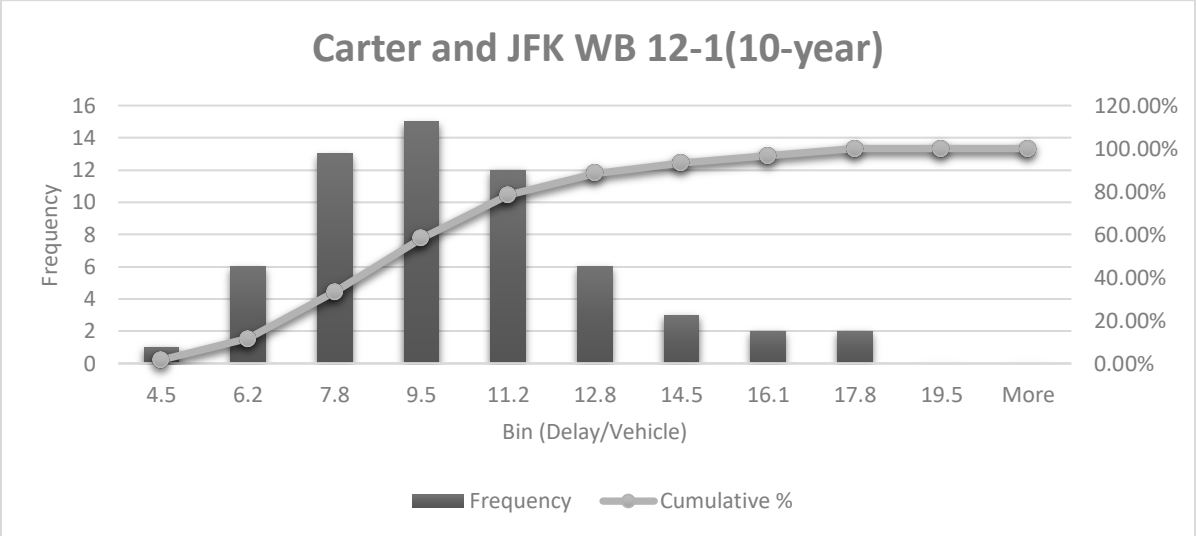

Figure 27. The total delay/vehicle the Carter and JFK intersection with a pedestrian median going westbound experiences 10 years from now during the 60 simula on runs from 12-1PM on a Saturday.

Of the 60 simulations ran at Carter Rd and JFK with a pedestrian median for a 10-year projected traffic forecast, around 80 percent resulted in a total delay per vehicle of 11.2 seconds or less going westbound. The minimum delay per vehicle for the westbound direction was 4.5 seconds, while the maximum delay was 17.8 seconds (with an average delay of 9.3 seconds). With 95 percent confidence, one could say that the total delay per vehicle would fall between 8.6 and 10.1 seconds for the westbound direction of Carter Rd and JFK with a pedestrian median.

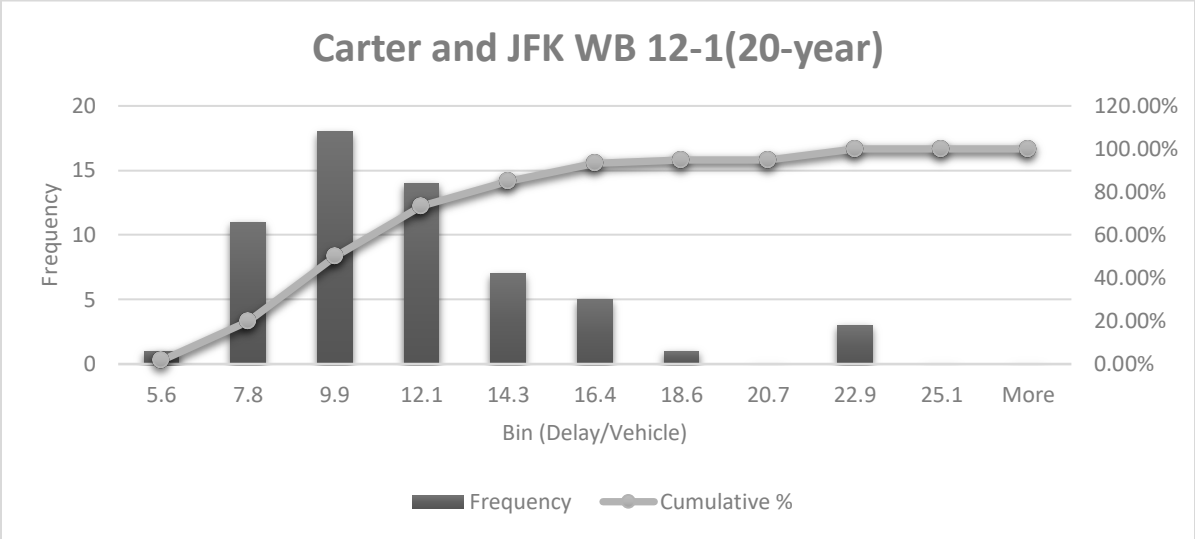

Figure 28. The total delay/vehicle the Carter and JFK intersection with a pedestrian median going westbound experiences 20 years from now during the 60 simulation runs from 12-1PM on a Saturday.

Of the 60 simulations ran at Carter Rd and JFK with a pedestrian median for a 20-year projected traffic forecast, around 80 percent resulted in a total delay per vehicle of 14.3 seconds or less going westbound. The minimum delay per vehicle for the westbound direction was 5.6 seconds, while the maximum delay was 22.9 seconds (with an average delay of 10.6 seconds). With 95 percent confidence, one could say that the total delay per vehicle would fall between 5.6 and 22.9 seconds for the westbound direction of Carter Rd and JFK with a pedestrian median.

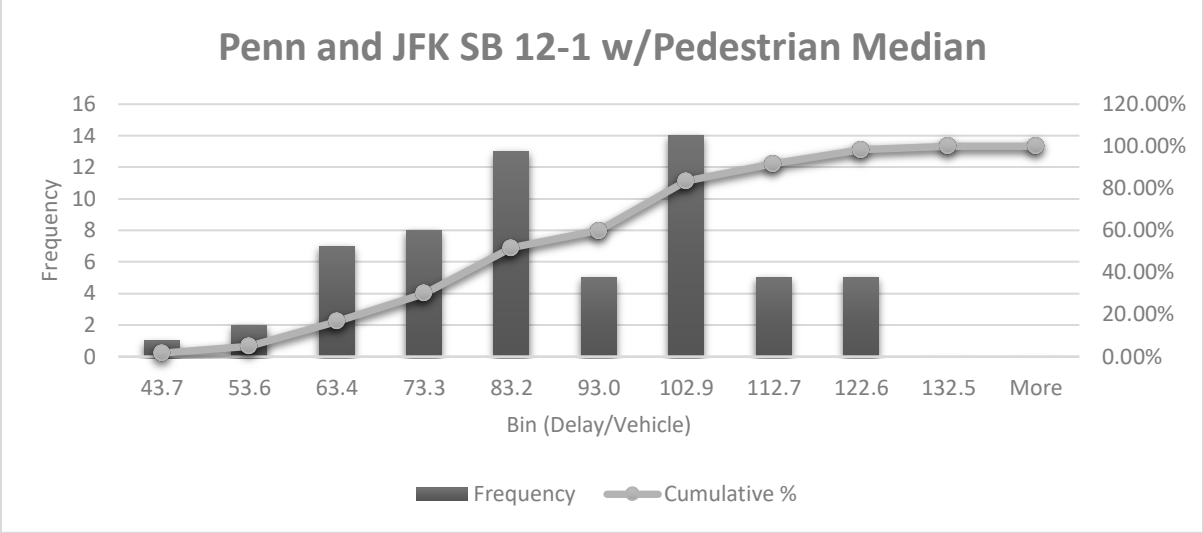

Figure 29. The total delay/vehicle the Pennsylvania and JFK intersection with a pedestrian median going southbound experienced during the 60 simulation runs from 12-1PM on a Saturday.

Of the 60 simulations run at Pennsylvania Ave and JFK with a pedestrian median, around 80 percent resulted in a total delay per vehicle of 102.9 seconds or less going southbound. The minimum delay per vehicle for the southbound direction was 43.7 seconds, while the maximum delay was 122.6 seconds (with an average delay of 84.8 seconds). With 95 percent confidence, one could say that the total delay per vehicle would fall between 79.8 and 89.9 seconds for the southbound direction of Pennsylvania Ave and JFK with a pedestrian median.

Section VI: Final Design Details

In the final design, the team recommends adding a sidewalk along the west side of JFK starting on the south side of Stoneman Rd down to the Wacker Dr and Kennedy Mall intersection. The team also recommends the reconstruction of the section of sidewalk adjacent to the Sunshine Family Restaurant.

Additionally, the team recommends adding crosswalk markings across the Kennedy mall entrance and Wacker Dr while also updating the crosswalk markings across JFK as seen in Figure 41. The group also proposes adding pedestrian pushbuttons at Wacker Dr and JFK also denoted by Figure 41.

The group also advises constructing a pedestrian median at the Carter Rd and JFK intersection and including flexible delineators on the sides of the sidewalk to help aid the safety of pedestrians. The flexible delineators will also make the cars less inclined to drive near the median. These delineators will be placed on the perimeter of the sidewalk as seen in Figure 42. Moreover, the group advises making the Carter Rd and Ridge Rd intersection a 3-way stop.

Finally, the team recommends implementing adjusted signal timing to reduce overall delay at both major signalized intersections at the southern portion of the John F Kennedy Rd corridor.

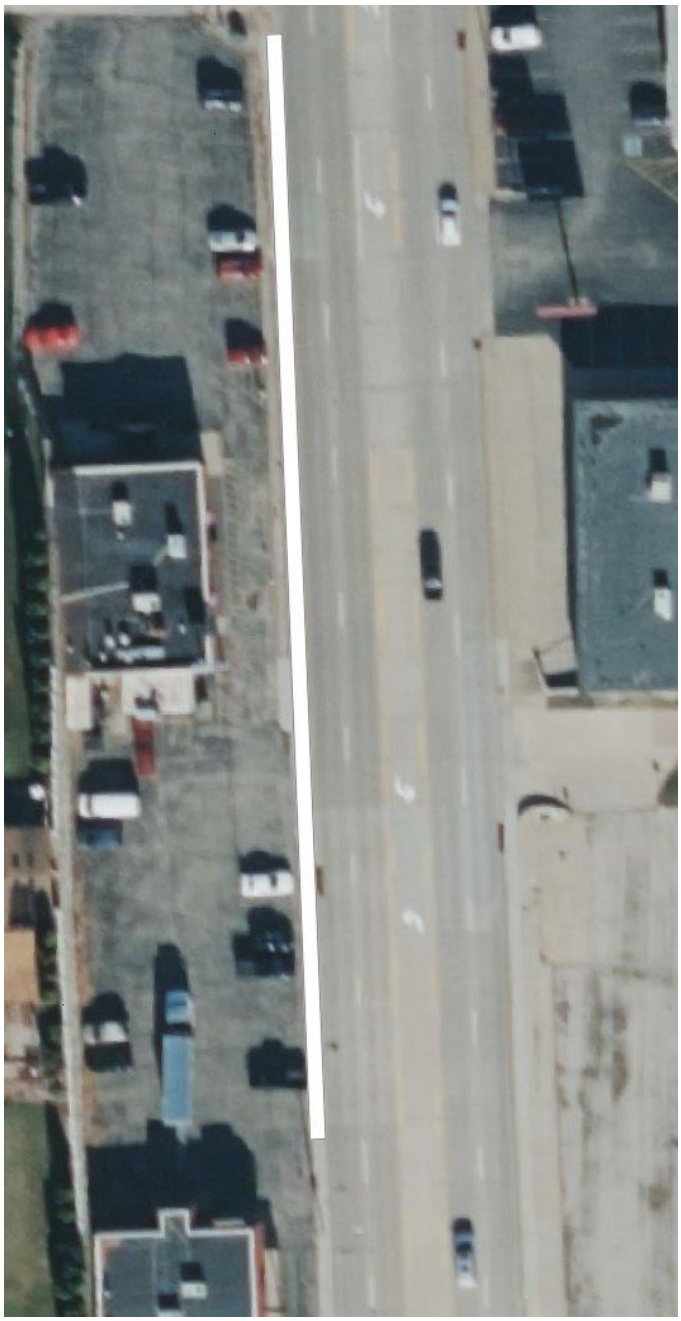

Figure 30. Proposed Sidewalk Reconstruction

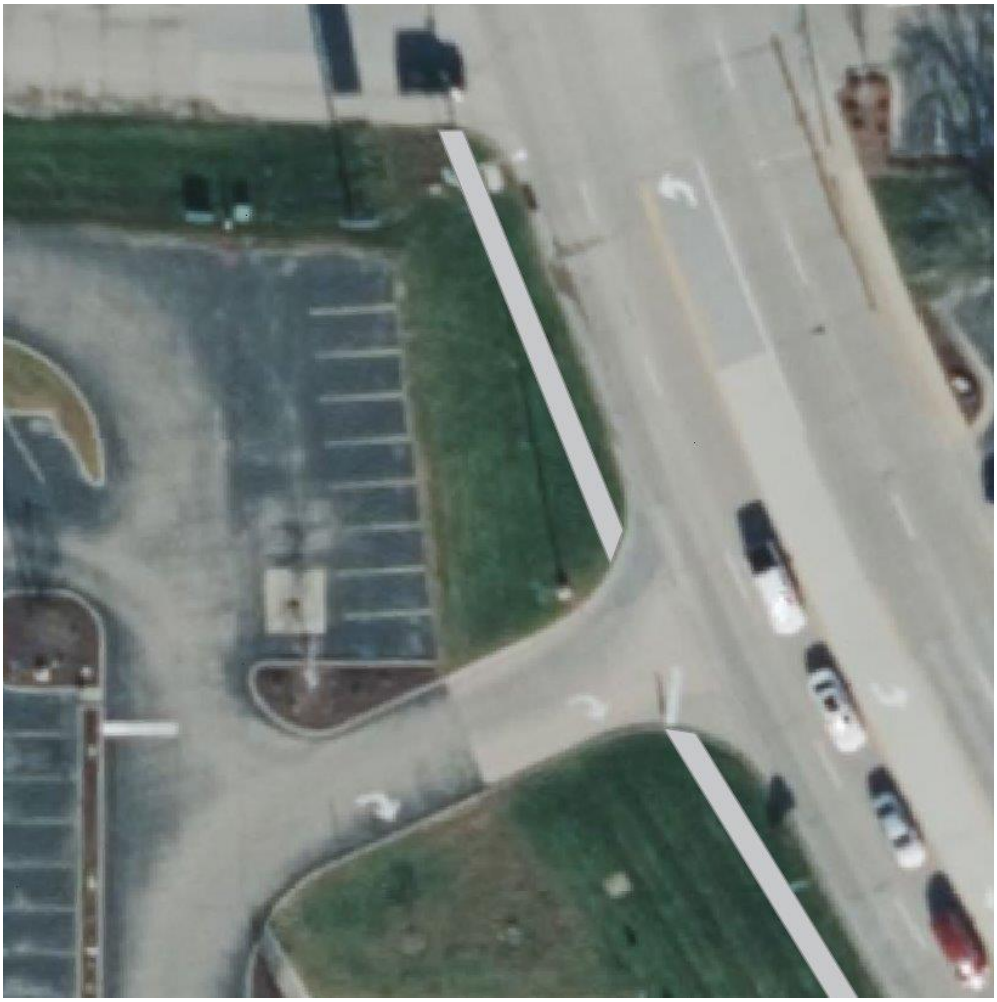

Figure 31. New Sidewalk South of Stoneman Rd

Figure 32. New Sidewalk Between Stoneman Rd and Wacker Dr

Figure 33. New Sidewalk at Wacker Dr Intersection

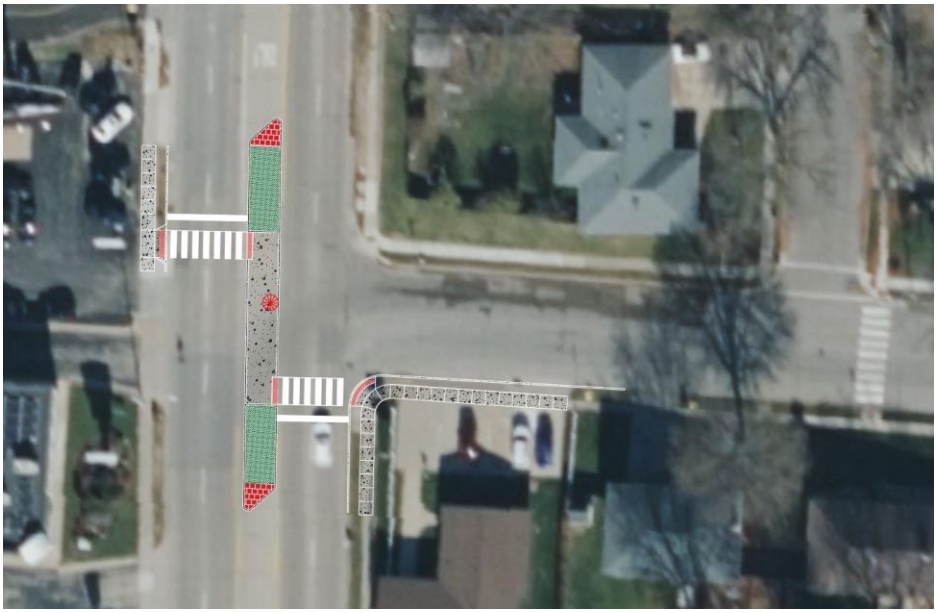

Figure 34. Proposed Pedestrian Median at Carter Rd and JFK

Figure 35. Ideal placement of the flexible delineators on the pedestrian median as denoted by a star.

Section VII: Engineer's Cost Estimate

The cost estimate was split into two sections. One for the sidewalk improvements and another for the pedestrian median. The sidewalk improvements include both the removal of the existing sidewalk next to the Sunshine Family Restaurant as well as the cost to replace it and add the new sidewalk. Also included is the estimated cost of the right of way acquisition for the new sidewalk, crosswalk pavement markings and pedestrian signs. The cost estimate for the pedestrian median includes the concrete, pavers, metal detectable warnings, flexible delineators, and stop signs. The total cost for both comes out to be $107,609.24. Adding an additional 20% contingency brings the total cost to $129,131.08.

Table 42. Budget Summary

Sidewalk Cost Estimate				
Item	Quantity	Unit	Unit Price	Total
Removal of sidewalk	194.90	SY	35	$ 6,821.50
Sidewalk PCC, 4"	443.57	SY	125	$ 55,446.0
Right of way Acquisition	1629.06	SF	3.89	$ 6,337.04
Crosswalk pavement markings	114	LF	1.27	$ 144.78
Pedestrian crosswalk signs	3	EACH	45.9	$ 137.70
Push button with sign and post	2	EACH	4715	$ 9,430.00
Sub-Total				$ 78,317.01
Pedestrian Median Cost Estimate				
Item	Quantity	Unit	Unit Price	Total
Brick Pavers	141.86	SF	11.09	$ 1,573.23
PCC	162.52	SY	125	$ 20,315.6
Detectable Warnings	20	EACH	162	$ 3,240.00
Top Soil 6"	656.8	SF	5.58	$ 3,664.94
Stop Signs 24" Octagon	2	EACH	34.25	$ 68.50
Flexible Delineators	10	EACH	43	$ 430.00
Sub-Total				$ 29,292.23
Total w/o Contingency				$107,609.24
20% Contingency				$ 21,521.85
Total				$129,131.08

Section VIII: Conclusions

Figure 36. Key points of concern along the John F Kennedy Rd Corridor.

The three main points of concern along the John F. Kennedy corridor are shown above. To improve pedestrian safety the team increased sidewalk connectivity and included additional crosswalks in areas of need. The team proposes construction of a pedestrian median at the intersection of Carter Rd and JFK. Moreover, the team recommends the installation of pedestrian pushbuttons at the intersection of Wacker Dr. and JFK to encourage freedom of pedestrian mobility and promote intersection safety. Additionally, the team recommends repainting intersection markings at both major intersections, especially that of the left hand turn from Wacker Dr. onto JFK (going northbound). Finally, the team recommends implementing adjusted signal timing to minimize overall delay at both major intersections.

Organization Qualifications and Experience

The team completing this report was comprised of University of Iowa students enrolled in the capstone design class in Civil & Environmental Engineering. They combined diverse expertise to tackle projects effectively. Connor Bobay specialized in the structural CEE program; John Lyons focusds on civil practic; Tony Pezzella and Payton Stuart specialized in transportation CEE . Payton Stuart served as the project manager, overseeing the operational traffic study and implementation. Tony Pezzella was the tech support manager, managing geometric enhancements. Connor Bobay and John Lyons served as editors, overseeing structural elements and support geometric and operational implementations.

Experience: Payton Stuart interned at a Cedar Rapids consulting firm, where he split his time between roadway design using Bentley's MicroStation and managing the city of Cedar Rapids sidewalk program. John Lyons gained experience with the Walsh Group, where he interned as part of the track team on the CTA Red Line project and worked in the transportation estimation department. Tony Pezzella interned at WSP, contributing to demolition cost estimation, Bentley product utilization for pavement patching and station labeling, and road/ sidewalk inspection. Currently, Tony is enrolled in a class that utilizes the traffic software "Synchro". Connor Bobay interned for the City of Cedar Rapids Public Works Department, collaborating with city inspectors, and overseeing various construction projects, including road reconstruction and sidewalk installation.

Constraints, Challenges, and Impacts

The project is limited to the evaluation of JFK in Dubuque, IA. The project's initial period of performance goes from 2/5/2024 to 5/3/2024. The section of JFK the project is focused on stretches from HWY 20 to Carter Rd. There is a limited number of camera angles at the JFK and Wacker Dr intersection. At the JFK and minor street intersections, no traffic cameras are available to count the turning movements. These intersections include JFK and University Ave, Daykin Ct, Stoneman Rd, Crestwood Dr, and Carter Rd. The improvement of the intersections is also limited to the property boundaries where one could expand the roadway or potentially add sidewalks. Some parts of the corridor have more space to work with than other parts where intruding into other properties would be an issue and a challenge to improve the area.

A major challenge of the project is to develop a solution that is cost-effective, while having a positive societal impact on residents. Ensuring community assets such as the elementary schools, churches, and the fire station are positively impacted is paramount. Accurately analyzing traffic flow through an intersection became more of a challenge with limited camera angles at Wacker and JFK. The team responded by utilizing Iowa Department of Transportation data to predict the quantity of vehicles taking a right off JFK, onto Wacker Dr. Another challenge of the project is helping the highway capacity software to correctly analyze flow. The non-traditional intersection at Wacker and JFK created software issues.

Another constraint is the limited ability to create a precise report of the minor street intersections with JFK. As the HCS software is incapable of doing a one-way stop control analysis. In turn a challenge involving the minor street intersections is the lack of volume in Crestwood Dr. creating a proximate report of what is occurring at the Crestwood and JFK intersection. Also, the Excel sheet cannot correctly estimate the University Ave. turning movements, making the team use the AADT data from the Iowa DOT.

Adding a sidewalk along JFK from Stoneman Rd through Wacker Dr could have a positive societal impact on the Dubuque community. The sidewalks would provide easier access for pedestrians to navigate the neighborhood while increasing safety. The addition of sidewalks would also encourage more people to walk or bike to their destination instead of driving. This in turn could also cause there to be less traffic on the roadway, which could improve the delay and level of service at some of the intersections where it is a problem. Changes involving the signal timing of corridor intersections could improve efficiency, allowing residents of Dubuque to arrive at their destination quicker. Consequently, residents may go through the corridor more frequently, feeling that the route is more reliable. This could increase the number of cars going through this section of roadway, which is good for businesses. Further examination is recommended to address these discrepancies and ensure accurate modeling of traffic conditions in this area.

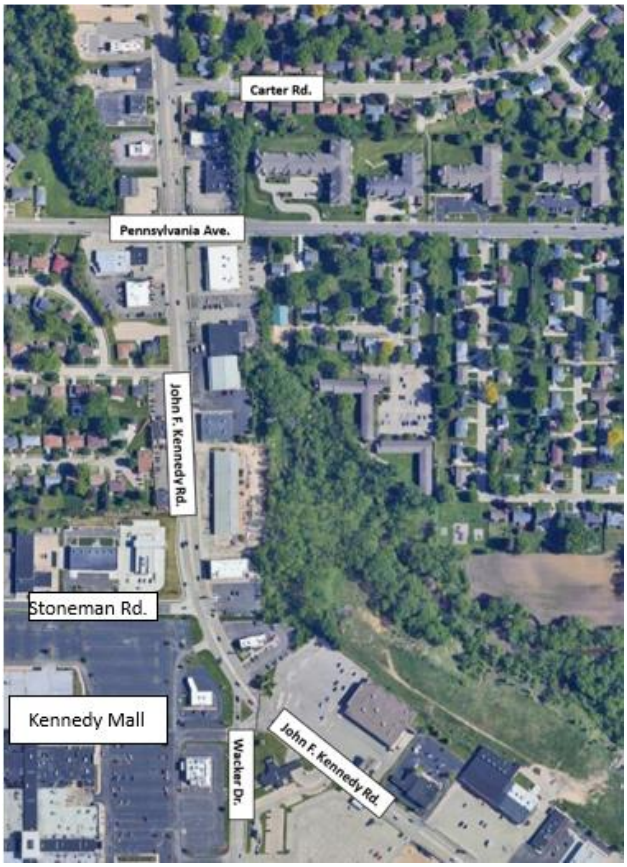

Figure 1. Aerial view displaying the southern portion of the JFK Corridor

Figure 2. Aerial View of Dubuque, IA with JFK Rd highlighted.

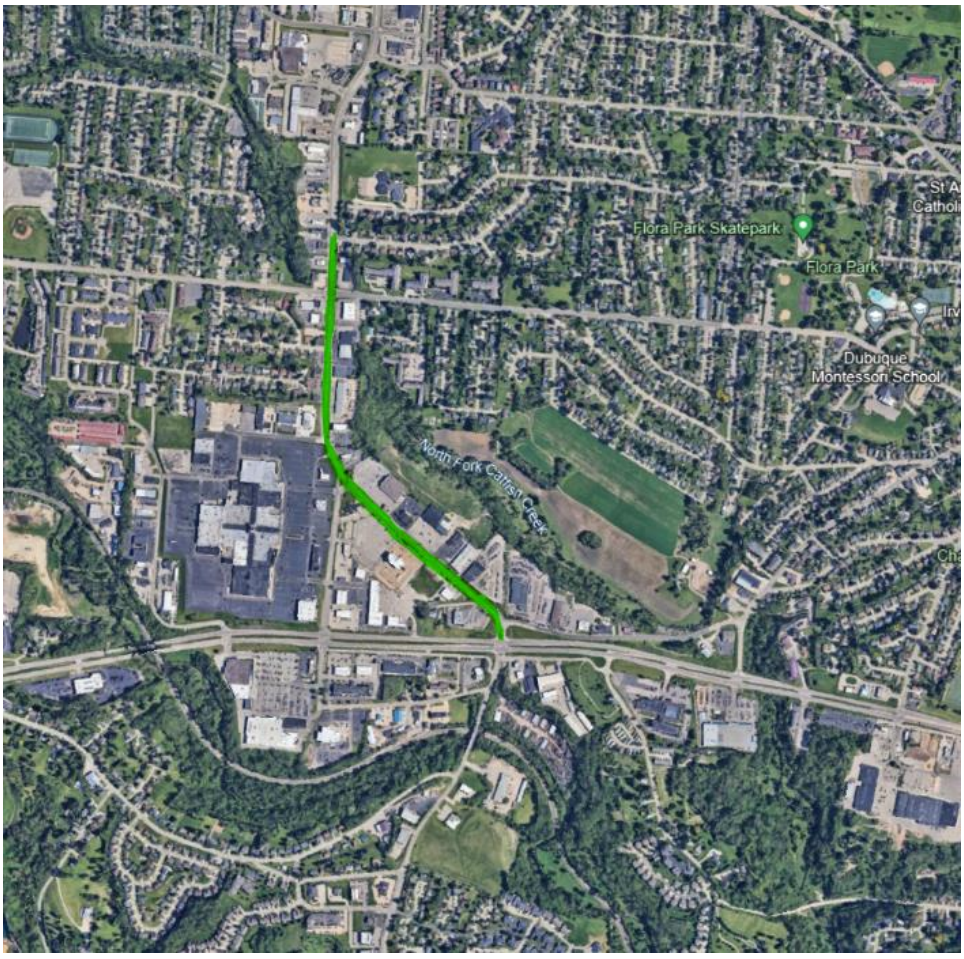

Figure 3. Aerial view of the section of JFK Rd the project is focused on.

The Gantt chart (Figure 4) presented below provides a visual representation of the allocation of time dedicated to each of the project's tasks. Each bar on the chart corresponds to a specific task, and the length of each bar illustrates the amount of time dedicated to completing that task. As Figure 45 shows, the most time-consuming project task was the evaluation of existing roadway conditions (using Highway Capacity and Synchro software).
